GAMMAGARD S/D [Immune Globulin Intravenous (Human)]
IgA less than 1 microgram per mL in a 5% Solution

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use GAMMAGARD S/D safely and effectively. See full prescribing information for GAMMAGARD S/D

GAMMAGARD S/D, Immune Globulin Intravenous (Human) IgA less than 1 microgram per mL in a 5% Solution

Initial U.S. Approval: 1994

WARNING: THROMBOSIS, RENAL DYSFUNCTION, and ACUTE RENAL FAILURE

See full prescribing information for complete boxed warning

- Thrombosis may occur with immune globulin products, including GAMMAGARD S/D. Risk factors may include advanced age, prolonged immobilization, hypercoagulable conditions, history of venous or arterial thrombosis, use of estrogens, indwelling vascular catheters, hyperviscosity and cardiovascular risk factors. (5.3)
- Renal dysfunction, acute renal failure, osmotic nephrosis, and death may occur in predisposed patients with immune globulin intravenous (IGIV) products, including GAMMAGARD S/D. Renal dysfunction and acute failure occur more commonly with IGIV products containing sucrose. GAMMAGARD S/D does not contain sucrose. (5.2)
- For patients at risk of thrombosis, administer GAMMAGARD S/D at the minimum dose and infusion rate practicable. Ensure adequate hydration in patients before administration. Monitor for signs and symptoms of thrombosis and assess blood viscosity in patients at risk of hyperviscosity. (5.3)

RECENT MAJOR CHANGES

Boxed Warning, Warnings and Precautions, Thrombosis (5.3) 09/2013

Warnings and Precautions, Transmissible Infectious Agents (5.7) 09/2013

INDICATIONS AND USAGE

GAMMAGARD S/D is an Immune Globulin Intravenous (Human) indicated for:

- Treatment of primary immunodeficiency (PI) in adults and pediatric patients two years of age or older. (1)
- Prevention of bacterial infections in hypogammaglobulinemia and/or recurrent bacterial infections associated with B-cell chronic lymphocytic leukemia (CLL). (1)
- Prevention and/or control of bleeding in adult chronic idiopathic thrombocytopenic purpura (ITP) patients. (1)
- Prevention of coronary artery aneurysms associated with Kawasaki syndrome in pediatric patients. (1)

DOSAGE AND ADMINISTRATION

Intravenous Use Only

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

* Administer concomitant aspirin therapy: 80-100 mg/kg/day in four divided doses

DOSAGE FORMS AND STRENGTHS

- Freeze-dried preparation containing 5 g or 10 g IgG. (3)

CONTRAINDICATIONS

- History of anaphylactic or severe systemic hypersensitivity reactions to the administration of GAMMAGARD S/D <1μg/mL IgA in a 5% solution. (4)
WARNINGS AND PRECAUTIONS

- IgA-deficient patients with antibodies to IgA are at greater risk of severe hypersensitivity reactions and anaphylactic reactions. (5.1)
- Monitor renal function, including blood urea nitrogen, serum creatinine, and urine output in patients at risk of acute renal failure. (5.2)
- Thrombosis may occur. Monitor for signs and symptoms of thrombosis and assess blood viscosity for those at risk for hyperviscosity. (5.3)
- Aseptic Meningitis Syndrome (AMS) has been reported (5.4)
- Hemolytic anemia can develop. Monitor patients for clinical signs and symptoms of hemolysis and hemolytic anemia. (5.5)
- Monitor patients for pulmonary adverse reactions (transfusion-related acute lung injury, TRALI). (5.6)
- Product is made from human blood and may carry a risk of transmitting infectious agents, e.g., viruses, the variant Creutzfeldt-Jakob disease (vCJD) agent, and theoretically, the Creutzfeldt-Jakob disease (CJD) agent. (5.7)
- Hyperproteinemia, increased serum viscosity, and alterations in serum sodium levels may occur. (5.8)

ADVERSE REACTIONS

- The most common adverse reactions observed in ≥5% of patients during the clinical trials were headache, nausea, chills, fatigue, pyrexia, upper abdominal pain, diarrhea, back pain, infusion site pain, hyperhidrosis and flushing. (6.1)
- Severe adverse reactions reported postmarketing include renal failure, thrombotic events (myocardial infarction, cerebrovascular accidents, and pulmonary embolism), anaphylactic shock, aseptic meningitis and hemolysis. (6.2)

To report SUSPECTED ADVERSE REACTIONS, contact Baxter Healthcare Corporation at 1-866-888-2472 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch

DRUG INTERACTIONS

Passive transfer of antibodies may interfere with the immune response to live vaccines, such as measles, mumps, and rubella. (7)

USE IN SPECIFIC POPULATIONS

- Pregnancy: No human or animal data. Use only if clearly indicated. (8.1)
- Geriatric: Do not exceed the recommended dose. Infuse GAMMAGARD S/D at the minimum infusion rate practicable. (8.5)

See Section 17 for PATIENT COUNSELING INFORMATION.

Revised: 04/2014

* Sections or subsections omitted from the full prescribing information are not listed.
FULL PRESCRIBING INFORMATION

WARNING: THROMBOSIS, RENAL DYSFUNCTION, and ACUTE RENAL FAILURE

- Thrombosis may occur with immune globulin products, including GAMMAGARD S/D. Risk factors may include advanced age, prolonged immobilization, hypercoagulable conditions, history of venous or arterial thrombosis, use of estrogens, indwelling vascular catheters, hypertensive and cardiovascular risk factors. Thrombosis may occur in the absence of known risk factors. [see Warnings and Precautions (5.3), Patient Counseling Information (17)]

- Renal dysfunction, acute renal failure, osmotic nephrosis, and death may occur in predispersed patients who receive immune globulin intravenous (IGIV) products, including GAMMAGARD S/D. Patients predisposed to renal dysfunction include those with any degree of pre-existing renal insufficiency, diabetes mellitus, age above 65, volume depletion, sepsis, paraproteinemia, or patients receiving known nephrotoxic drugs. Renal dysfunction and acute renal failure occur more commonly in patients receiving IGIV product containing sucrose. GAMMAGARD S/D does not contain sucrose. (5.2)

- For patients at risk of thrombosis, administer GAMMAGARD S/D at the minimum dose and infusion rate practicable. Ensure adequate hydration in patients before administration. Monitor for signs and symptoms of thrombosis and assess blood viscosity in patients at risk of hypertocviscosity. [see Dosage and Administration (2.3) and Warnings and Precautions (5.3)]

1 INDICATIONS AND USAGE

Primary Immunodeficiency (PI)
GAMMAGARD S/D is indicated for the treatment of primary immunodeficiency (PI) associated with defects in humoral immunity, in adults and children two years and older. This includes, but is not limited to, congenital agammaglobulinemia, common variable immunodeficiency, Wiskott-Aldrich syndrome, and severe combined immunodeficiencies. 1,2,3

B-cell Chronic Lymphocytic Leukemia (CLL)
GAMMAGARD S/D is indicated for prevention of bacterial infections in patients with hypogammaglobulinemia and/or recurrent bacterial infections associated with B-cell chronic lymphocytic leukemia (CLL). 4

Idiopathic Thrombocytopenic Purpura (ITP)
GAMMAGARD S/D is indicated for the treatment of adult chronic idiopathic thrombocytopenic purpura to increase platelet count and to prevent and/or to control bleeding.

Kawasaki Syndrome
GAMMAGARD S/D is indicated for the prevention of coronary artery aneurysms associated with Kawasaki syndrome in pediatric patients. 5

2 DOSAGE AND ADMINISTRATION

For Intravenous Use Only

2.2 Dose

Primary Immunodeficiency (PI)
The recommended dose of GAMMAGARD S/D for patients with PI is 300-600 mg/kg infused at 3 to 4 week intervals. 1,2,4 Adjust dose according to the clinical response: the frequency and dose of immunoglobulin may vary from patient to patient. No randomized controlled clinical trials are available to determine an optimum target trough serum IgG level.

B-cell Chronic Lymphocytic Leukemia (CLL)
The recommended dose of GAMMAGARD S/D for patients with hypogammaglobulinemia and/or recurrent bacterial infections due to B-cell CLL is 400 mg/kg body weight infused at every 3 to 4 week intervals. 6

Idiopathic Thrombocytopenic Purpura (ITP)
The recommended dose of GAMMAGARD S/D for patients with chronic ITP is 1 g/kg. The need for additional doses can be determined by clinical response and platelet count. Up to three separate doses may be given on alternate days if required.

2.1 Preparation and Handling

Instructions for Reconstitution:
Allow GAMMAGARD S/D and diluent to reach room temperature before reconstitution and administration if refrigerated.

Reconstitution:
1. Remove caps from concentrate and diluent bottles to expose central portion of rubber stoppers and cleanse stoppers with germicidal solution.
   - To make a 5% solution: Use the full volume of the diluent bottle
   - To make a 10% solution: Remove half of the volume of the diluent bottle

Table 1 indicates the volume of diluent to be removed from the vial before attaching the transfer device to produce a 10% concentration. Using aseptic technique, withdraw the unnecessary volume of diluent using a sterile hypodermic syringe and needle. Discard the filled syringe into a suitable puncture proof container (sharps container).
Kawasaki Syndrome

The recommended dose of GAMMAGARD S/D for patients with Kawasaki syndrome is either a single 1 g/kg dose or a dose of 400 mg/kg for four consecutive days beginning within seven days of the onset of fever, administered concomitantly with aspirin therapy (80-100 mg/kg/day in four divided doses).2,3,4

2.3 Administration

Administer GAMMAGARD S/D as soon after reconstitution as possible and administer the reconstituted material at room temperature.

The recommended initial 5% solution infusion rate is 0.5 mL/kg/hour. The infusion rate may be gradually increased to a maximum rate of 4 mL/kg/hour as tolerated for patients with no history of adverse reactions to IGIV and no significant risk factors for renal dysfunction or thrombotic complications. Patients who tolerate the 5% concentration at 4 mL/kg/hour can be infused with the 10% concentration starting at 0.5 mL/kg/hour. The rate can be increased gradually up to a maximum of 8 mL/kg/hour if no adverse effects occur.5

Monitor patient vital signs throughout the infusion. Certain adverse reactions such as headaches, flushing and changes in pulse rate and blood pressure may be related to the rate of infusion. Slow or stop the infusion if adverse reactions occur. If symptoms subside promptly, the infusion may be resumed at a lower rate that does not result in reoccurrence of the symptoms.

It is recommended that, if possible, the antecubital veins are used, especially for 10% preparation containing 5 g or 10 g IgG in a single-use vial.

2.4 Dosage Forms and Strengths

GAMMAGARD S/D with an IgA concentration of less than 1 μg/mL is a freeze-dried preparation containing 5 g or 10 g IgG in a single-use vial.

4 CONTRAINDICATIONS

GAMMAGARD S/D is contraindicated in patients who have a history of anaphylactic or severe systemic hypersensitivity reactions to the administration of GAMMAGARD S/D with <1μg/mL IgA in a 5 % solution.

5 WARNINGS AND PRECAUTIONS

5.1 Hypersensitivity

Severe hypersensitivity reactions and anaphylactic reactions with a fall in blood pressure have occurred in patients receiving GAMMAGARD S/D, including patients who tolerated previous treatments with GAMMAGARD S/D, even though it contains low levels of IgA. If hypersensitivity reaction develops, discontinue GAMMAGARD S/D infusion immediately and institute appropriate treatment.

This product has an IgA concentration less than 1 μg/mL. Preparations depleted of IgA (0.4 to 2.9 μg/mL) were shown to be better tolerated by a limited number of patients who reacted to IGIV preparations with higher IgA concentrations. However, the concentration of IgA that will not provoke a reaction is not known, and therefore all IGIV preparations carry the risk of inducing an anaphylactic reaction to IgA. In such instances, a risk of anaphylaxis may exist despite the fact that GAMMAGARD S/D, IgA < 1 μg/mL, contains < 1 μg/mL IgA.

5.2 Renal Dysfunction/Failure

Acute renal failure has been reported in association with GAMMAGARD S/D. Acute renal dysfunction/failure, acute tubular necrosis, proximal tubular nephropathy, osmotic nephrosis and death have been reported in patients receiving IGIV, particularly those products containing sucrose.2,7 GAMMAGARD S/D does not contain sucrose.

Ensure that patients are not volume depleted prior to the initiation of the infusion of GAMMAGARD S/D. In patients who are at risk of developing renal dysfunction, because of pre-existing renal insufficiency or predisposition to acute renal failure (such as diabetes mellitus, age greater than 65, volume depletion, sepsis, paraproteinemia, or patients receiving known nephrotoxic drugs, etc.). administer GAMMAGARD S/D at an infusion rate less than 4 mL/kg/hour (< 3.3 mg Ig/kg/min) for a 5% solution or at a rate less than 2 mL/kg/hour (< 3.3 mg Ig/kg/min) for a 10 % solution [see Dosage and Administration (2.3)].

Monitor renal function and urine output in patients judged to be at increased risk for developing acute renal failure. Assess renal function, including measurement of blood urea nitrogen (BUN) and serum creatinine, before the initial infusion of GAMMAGARD S/D and again at appropriate intervals thereafter. If renal function deteriorates, consider discontinuation of GAMMAGARD S/D.

5.3 Thrombosis

Thrombosis may occur following treatment with immune globulin products, including GAMMAGARD S/D. Risk factors may include advanced age, prolonged immobilization, hypercoagulable conditions, history of venous or arterial thrombosis, use of estrogens, indwelling central vascular catheters, hyperviscosity, and cardiovascular risk factors. Thrombosis may occur in the absence of known risk factors.

Consider baseline assessment of blood viscosity in patients at risk for hyperviscosity, including those with cryoglobulins, fasting chylomicronemia marked by high triglycerides (triglycerides), or monoclonal gammopathies. For patients at risk of thrombosis, administer GAMMAGARD S/D at the minimum dose and infusion rate practicable. Ensure adequate hydration in patients before administration. Monitor for signs and symptoms of thrombosis and assess blood viscosity in patients at risk for hyperviscosity [see Boxed Warning, Dosage and Administration (2.3), Patient Counseling Information (17)].

5.4 Aseptic Meningitis Syndrome (AMS)

AMS has been reported to occur in association with IGIV therapy, including GAMMAGARD S/D. Discontinuation of IGIV treatment has resulted in remission of AMS within several days without sequelae. The syndrome of AMS usually begins within several hours to two days following IGIV treatment.

AMS is characterized by the following symptoms and signs: severe headache, nuchal rigidity, drowsiness, fever, photophobia, painful eye movements, nausea, and vomiting. Cerebrospinal fluid (CSF) studies are frequently positive with pleocytosis up to several thousand cells per cubic mm, predominantly from the granulocytic series, and with elevated protein levels up to several hundred mg/dL, but negative culture results. Conduct a thorough neurological examination on patients exhibiting such symptoms and signs, including CSF studies, to rule out other causes of meningitis.

AMS may occur more frequently with high dose (2 g/kg) IGIV treatment.11

5.5 Hemolysis

Hemolytic anemia can develop subsequent to IGIV therapy, including GAMMAGARD S/D, [see Adverse Reactions (6.2), GAMMAGARD S/D contains blood group antibodies which may act as hemolisins and induce in vivo coating of red blood cells (RBC) with immunoglobulin, causing a positive direct antiglobulin reaction and, rarely, hemolysis. Acute intravascular hemolysis has been reported, and delayed hemolytic anemia can develop subsequent to IGIV therapy due to enhanced RBC sequestration [see Adverse Reactions (6.2)].

Monitor patients for clinical signs and symptoms of hemolysis. If signs or symptoms of hemolysis are present after GAMMAGARD S/D infusion, perform appropriate confirmatory laboratory testing.

5.6 Transfusion-Related Acute Lung Injury (TRALI)

Non-cardiogenic pulmonary edema (TRALI) has been reported in patients following the administration of immunoglobulin products, including GAMMAGARD S/D therapy [see Adverse Reactions (6.2)]. TRALI is characterized by severe respiratory distress, pulmonary edema, hypoxemia, normal left ventricular function, and fever. Symptoms typically occur within 1 to 6 hours after treatment.

Monitor patients for pulmonary adverse reactions. If TRALI is suspected, perform appropriate tests for the presence of anti-neutrophil and anti-HLA antibodies in both the product and patient serum. TRALI may be managed using oxygen therapy with adequate ventilatory support.

5.7 Transmissible Infectious Agents

Because GAMMAGARD S/D is made from human blood and may carry a risk of transmitting infectious agents, e.g., viruses the variant Creutzfeldt–Jakob disease (vCJD) agent and theoretically, the Creutzfeldt–Jakob disease (CJD) agent. This also applies to unknown or emerging viruses and other pathogens.

All infections thought by a physician possibly to have been transmitted by this product should be reported by the physician or other healthcare provider to Baxter Healthcare Corporation at 1-800-423-2862 (in the U.S.) or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch. The physician should discuss the risks and benefits of this product with the patient.

5.8 Hyperproteinemia, Increased Serum Viscosity, and Alterations in Serum Sodium Levels

Hyperproteinemia and increased serum viscosity may occur in patients receiving GAMMAGARD S/D. Alterations in serum sodium levels, such as hypernatremia acutely, or pseudohyponatremia after equilibration of the sodium, may occur with the administration of GAMMAGARD S/D.
The amount of sodium in the product may add materially to the recommended daily allowance of dietary sodium for patients on a low sodium diet. In these patients, calculate the amount of sodium from the product and use it when determining dietary sodium intake. GAMMAGARD S/D contains approximately 0.85% NaCl or approximately 3340 mg sodium/liter at a 5% concentration. A 70 kg patient receiving 1g/kg (1.4 L) of the product would receive 4676 mg of sodium.

5.9 Monitoring: Laboratory Tests
- Monitor renal function and urine output in patients at increased risk of developing acute renal failure. Assess renal function, including measurement of BUN and serum creatinine, before the initial infusion of GAMMAGARD S/D and at appropriate intervals thereafter."^16
- Assess baseline blood viscosity in patients at risk for hyperviscosity, including those with cryoglobulins, fasting chylomicronemia/markedly high triglycerides (triglycerides), or monoclonal gammapathies because of the potentially increased risk of thrombosis.
- If signs or symptoms of hemolysis are present after an infusion of GAMMAGARD S/D, perform appropriate laboratory testing for confirmation.
- If TRALI is suspected, perform appropriate tests for the presence of anti-neutrophil antibodies and anti-HLA antibodies in both the product and patient’s serum.

5.10 Interference with Laboratory Tests
After infusion of IgG, the transitory rise of the various passively transferred antibodies in the patient’s blood may yield false positive serological testing results, with the potential for misleading interpretation. Passive transmission of antibodies to erythrocyte antigens (e.g., A, B, and D) may cause a positive direct or indirect antiglobulin (Coombs’) test.

6 ADVERSE REACTIONS
The most common adverse reactions reported in ≥ 5% of clinical trial subjects occurring during or within 48 hours of an infusion were headache, nausea, chills, asthenia (fatigue), pyrexia, upper abdominal pain, diarrhea, back pain, pyrexia, and flushing. There were no serious adverse events that were attributed to GAMMAGARD S/D in the clinical trials.

In postmarketing surveillance, serious adverse reactions reported with GAMMAGARD S/D were anaphylaxis, acute renal failure, myocardial infarction, cerebral vascular accident, transient ischemic attack, deep vein thrombosis, pulmonary embolism, asptic meningitis, acute hemolysis, and TRALI.

6.1 Clinical Trials Experience
Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

Primary Immunodeficiency (PI)
In 17 patients receiving GAMMAGARD (5% solution) for 56 to 77 months, 12 (71%) were adults, and 5 (29%) were children (16 years or younger)."^3 Adverse reactions are those adverse events (AEs) that were deemed by the investigators as causally related to the infusion of GAMMAGARD. Twenty-one adverse reactions occurred in 6 of the 17 subjects treated with GAMMAGARD S/D for an average of 7.7 months. Adverse reactions included fever and chills. Sleepiness was noted during 4 infusions. One subject had a myocardial infarction which was considered to be unrelated to the GAMMAGARD. Twenty-four of the adverse reactions that occurred in ≥ 5% of subjects during or within 48 hours of infusion are listed in Table 2.

The tolerability and viral safety of GAMMAGARD S/D were evaluated in a study of 38 subjects treated with GAMMAGARD S/D for an average of 7.7 months. Adverse reactions were reported from 20 of the 38 subjects (52.6%) in 50 of the total 394 infusions (12.7%) during or within 48 hours of an infusion. Twenty-four (48%) of the adverse reactions occurred in 3 subjects and 26 occurred in the other 35 subjects in 350 infusions. No subject withdrew during the study. Five subjects had a transient borderline elevation in liver enzyme (AST). No subject developed a positive serologic response to hepatitis C or HIV. There were no other significant laboratory abnormalities.

The adverse experiences of GAMMAGARD S/D reconstituted as a 10% solution and the maximal tolerated infusion rate were examined in a post-marketing study of 27 subjects. Local pain and/or irritation occurred in 42 of the total 276 infusions (15.2%). Ninety percent of the reactions occurred when the patients received the 10% solution compared to the 5% control. These local reactions tended to be more common following hand vein infusions and their incidence may be reduced by infusions via the antecubital vein. Application of a warm compress to the infusion site alleviated local symptoms. Twenty-six subjects achieved the maximal infusion rate of 8 mL/kg/hour with the GAMMAGARD S/D reconstituted to a 10% solution.

B-cell Chronic Lymphocytic Leukemia (CLL)
In the study of 81 patients with B-cell CLL, the incidence of adverse reactions following GAMMAGARD infusions was approximately 1.3% compared to the rate of the placebo (normal saline) group which was 0.6%."^3 There were 23 adverse reactions associated with the 1235 infusions in the study. Sixteen of the adverse reactions occurred in the GAMMAGARD group (1.6%) and 7 in the control group (0.6%). The most common reactions were fever and chills. Sleepiness was noted during 4 infusions. One subject had a myocardial infarction which was considered to be unrelated to the GAMMAGARD. Twenty-four of the subjects did not complete all 17 infusions. Three subjects in each group died during the

In a double-blind, crossover study, 36 subjects with PI were treated for 6 months with GAMMAGARD S/D and 6 months with Gamimune N. One hundred AEs were considered to be possibly or probably related to treatment with GAMMAGARD S/D. Of these, 72 were mild, 24 were moderate, and 4 were severe. The numbers and percentages of AEs were similar for GAMMAGARD S/D and Gamimune N. There were no deaths during the study. The adverse reactions that occurred during GAMMAGARD S/D treatment in ≥ 5% of subjects in the study are shown in Table 3.

</table>

In 10 subjects who participated in a PK crossover study of GAMMAGARD and GAMMAGARD S/D, 5 adverse reactions were reported to be associated with the total 28 infusions (17.5%). Three of the adverse reactions were associated with 10 GAMMAGARD infusions and 2 were associated with 18 GAMMAGARD S/D infusions. Two subjects withdrew from the study. One subject developed a recurrence of chronic cellulitis and was hospitalized, but the event was not considered to be related to study drug. The other subject withdrew because of moderate severe adverse reactions including chills, anxiety, and increased temperature after infusion of GAMMAGARD.

Adverse reactions that occurred in the PK study and in the safety study are shown in Table 4.
7 DRUG INTERACTIONS

Admixtures of GAMMAGARD S/D with other drugs or intravenous solutions have not been evaluated. It is recommended that GAMMAGARD S/D be administered separately from other drugs or medications which the patient may be receiving. Do not mix the product with human IVG products from other manufacturers.

Passive transfer of antibodies may transiently impair the immune responses to live attenuated vaccines, such as measles, mumps, rubella, and varicella. Inform the immunizing physician of recent therapy with GAMMAGARD S/D so that appropriate attenuated vaccines, such as measles, mumps, rubella, and varicella, can be administered. Do not mix the product with other drugs or medications which the patient may be receiving. Do not mix the product with human IVG products from other manufacturers.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Pregnancy Category C. Animal reproduction studies have not been conducted with GAMMAGARD S/D. It is also not known whether GAMMAGARD S/D can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Immunoglobulins cross the placenta from maternal circulation increasing after 30 weeks of gestation. GAMMAGARD S/D should be given to a pregnant woman only if clearly needed.

8.2 Breastfeeding

It is not known whether GAMMAGARD S/D is excreted in breast milk. Because adverse reactions are reported voluntarily post-approval from a population of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to product exposure.

In addition to the events listed above, the following events have been identified for IGIV in general:

Blood and Lymphatic System Disorders
- Anemia, hemorrhage, lymphadenopathy, thrombocytopenia

Immune System Disorders
- Anaphylactic shock, anaphylactic/anaphylactoid reaction, hyperreactivity

Psychiatric Disorders
- Restlessness

Nervous System Disorders
- Apoptic meningitis, cerebrovascular accident, transient ischemic attack, convulsion, dizziness, migraine, paresthesia, syncope, tremor

Eye Disorders
- Retinal vein thrombosis, eye pain, photophobia, visual disturbance

Cardiac Disorders
- Myocardial infarction, anemia, tachycardia, bradycardia

Vascular Disorders
- Vena cava thrombosis, arterial thrombosis, deep vein thrombosis, hypotension, hypertension, palmar, thrombocytopenia

Respiratory, Thoracic and Mediastinal Disorders
- Pulmonary embolism, pulmonary edema, bronchospasm, wheezing, cough, hyperventilation, hypoxia, throat tightness

Gastrointestinal Disorders
- Abdominal pain, dyspepsia

Hepatobiliary Disorders
- Non-infectious hepatitis

Skin and Subcutaneous Tissue Disorders
- Angioedema, dermatitis, erythema, rash

Musculoskeletal and Connective Tissue Disorders
- Arthritis, myalgia

Renal and Urinary Disorders
- Renal failure

General Disorders and Administration-Site Conditions
- Infusion site reaction, asthenia, edema, rigors

Infections
- Positive direct Coombs test

In addition to the events listed above, the following events have been identified for IGN products in general:

Renal
- Osmotic nephrosis

Respiratory
- Cyanosis, apnea, acute respiratory distress syndrome (ARDS)

Integumentary
- Bullous dermatitis, epidermolysis, erythema multiforme, Stevens-Johnson syndrome

Cardiovascular
- Cardiac arrest, vascular collapse

Neurological
- Coma, loss of consciousness

Hematologic
- Pancreatitis

Gastrointestinal
- Hepatic dysfunction

10 OVERDOSAGE

Overdose may lead to fluid overload or hyperviscosity. Patients at particular risk for complications of fluid overload or hyperviscosity include elderly patients and patients with cardiac or renal impairment.
In the manufacturing process includes treatment with an organic solvent/detergent mixture, composed of tri-n-butyl phosphate, octylxyl and polyethylene 80. The GAMMAGARD S/D manufacturing process provides for viral reduction in in vitro studies. These studies, summarized in Table 6 demonstrate virus clearance during GAMMAGARD S/D manufacturing using human immunodeficiency virus, Type 1 (HIV-1), as the relevant virus and model for HIV-2, bovine viral diarrhea virus (BVDV), a model virus for enveloped RNA viruses such as hepatitis C virus (HCV); pseudorabies virus (PRV), a generic model virus for enveloped DNA viruses such as hepatitis B virus (HBV); encephalomyocarditis virus (EMCV), a model for non-enveloped RNA viruses such as hepatitis A virus (HAV); HAV; and mice minute virus (MMV), a model for small non-enveloped DNA viruses such as human parvovirus B19 (B199). These reductions are achieved through partitioning and inactivation during cold ethanol fractionation, and the solvent/detergent treatment.

### Table 6

* These values are not included in the computation of the cumulative reduction of virus since the virus clearance is within the variability limit of the assay. ** NA: Not Applicable. Solvent/detergent treatment does not affect non-enveloped viruses. NT: Not Tested.

### 12 CLINICAL PHARMACOLOGY

#### 12.1 Mechanism of Action

GAMMAGARD S/D, Immune Globulin Intravenous (Human), supplies a broad spectrum of opsonizing and neutralizing IgG antibodies against a wide variety of bacterial and viral agents. GAMMAGARD S/D also contains a spectrum of antibodies capable of reacting with B-cell Chronic Lymphocytic Leukemia (CLL)

#### 12.3 Pharmacokinetics

Following infusion, IVIG products show a biphasic decay curve. The initial (α) phase is characterized by an immediate post-infusion peak in serum IgG and is followed by rapid decay due to equilibration between the plasma and extravascular fluid compartments. The second (β) phase is characterized by a slower and constant rate of decay. As a class, IgG survives longer in vivo than other serum proteins. Peak levels of IgG are reached within 30 minutes after an intravenous infusion of GAMMAGARD S/D. Post-infusion levels of IgG are maintained for 30 days with a shortened half-life of IgG.

The pharmacokinetics of GAMMAGARD S/D were evaluated in 15 subjects with PI, 10 of whom were previously treated. In the previously treated subjects, the half-life of GAMMAGARD S/D was approximately 37.7 ± 15 days compared to 51 ± 17.5 days for GAMMAGARD. The half-lives of the IgG subclasses were similar, ranging from 28.1 ± 11.2 days for IgG1 to 42.3 ± 26.6 days for IgG4. The half-life of pneumococcal antibody in these subjects was 41.4 ± 28.5 days. Pharmacokinetics did not differ between the previously licensed IGIV and GAMMAGARD S/D formulations administered to the previously treated patients. The pharmacokinetics of the GAMMAGARD S/D formulation in previously untreated patients were not significantly different from the results obtained in previously treated patients. The mean trough IgG concentration in the previously untreated patients was 1186 ± 614 mg/dL and the peak post-infusion concentration was 1859 ± 872 mg/dL. The mean dose was 460 ± 194 mg/kg.

### 14 CLINICAL STUDIES

Clinical studies were conducted with lots of GAMMAGARD S/D containing IgA < 2.2 μg/mL. No clinical studies have been specifically conducted using only lots with IgA content of < 1 μg/mL.

Primary Immunodeficiency (PI)

Intravenous use of GAMMAGARD was initially evaluated in a study of 17 subjects with PI. Twelve (71%) were adults and 5 (29%) were children 16 years or younger. Six subjects received a series of 5 infusions at 4-week intervals, with the starting infusion dose of 100 mg/kg and then increased to 200, 300, and 400 mg/kg at 0.1 to 0.2 mg/kg/hour. Five of the 6 subjects completed the 5 infusions and received another 6 monthly infusions with the following doses each administered twice: 200–400 mg/kg at 0.1 to 0.2 mg/kg/hour, 400 mg/kg at 0.1 to 0.4 mg/kg/hour and 400-800 mg/kg at 0.1 to 0.4 g/kg/hour. Then all of the 17 subjects received GAMMAGARD at 400 mg/kg every 4 weeks at a rate of 0.1 to 0.4 mg/kg/hour. Fifteen of the subjects were treated for 56 to 77 weeks in this study. There were no instances of pneumonia or other infections that would qualify as an acute bacterial infection. The overall rate of non-serious bacterial infections was 4.4 per subject per year.

In a study of 15 subjects with PI to compare the pharmacokinetics of GAMMAGARD S/D with GAMMAGARD, the subjects received a total of 28 infusions, half with GAMMAGARD S/D and half with GAMMAGARD. Five systemic AEs were reported during the study and 2 occurred with GAMMAGARD S/D treatment. The study then enrolled an additional 38 patients with the diagnosis of PI (6), TTP (13), CID (6), CLL (2) and other miscellaneous diseases (3) to evaluate acute tolerability and the viral safety of GAMMAGARD S/D. The mean age of the subjects was 12 years old (range 0.7 to 57.2 years); 17 were males and 21 were females. The subjects received an average of 10 (range 1-22) infusions over an average of 7.7 months (range 3.3-11 months). A total of 394 infusions were administered and all were completed. The average dose was 460 mg/kg (range: 188-1110 mg/kg). Incidence of infections was not recorded, although one subject had a recurrence of chronic cellulitis. Adverse events and viral safety data were analyzed (see Adverse Reactions).

GAMMAGARD S/D was compared to Gamimune N in a double-blind, crossover study of 36 PI subjects. The mean age of subjects was 17.9 years (range 1.7 to 55.3 years); 22 subjects were male and 14 were female. Eighteen were naive to IGIV therapy. Each subject received 6 infusions of both products. There were a total of 211 GAMMAGARD S/D infusions and 210 Gamimune N infusions. The dose of GAMMAGARD S/D administered was 300-600 mg/kg every 4 to 28 days for previously untreated subjects and the same as their pre-study dose and frequency for previously treated subjects. The infusions were started at 1.0 mL/kg/hour and increased every 30 minutes to a maximum of 4.8 mL/kg/hour as tolerated. The mean dose administered for both products was 440 mg/kg. The mean infusion rate was 2.35 ± 0.54 mL/kg/hour for GAMMAGARD S/D and 2.33 ± 0.71 mL/hour for Gamimune N. Two subjects withdrew from the study. One subject was pregnant, and the other subject was withdrawn by his parents after the eighth infusion for reasons other than adverse events.

The use of GAMMAGARD S/D as a 1% solution and the maximal rate of infusion were evaluated in a postmarketing study of 27 subjects with PI. Subjects were treated with GAMMAGARD S/D at 400 mg/kg every 4 weeks for up to 12 months. Each subject received an initial infusion of GAMMAGARD S/D 5% solution at 4 mL/kg/hour. Subsequently, the concentration was increased to 7.5% and then to 10% as tolerated. Thereafter, the infusion rate was gradually increased to a maximal 8 mL/kg/hour as tolerated. There were 278 infusions administered and 26 of the 27 subjects were able to reach the maximum infusion rate and concentration.

**B-cell Chronic Lymphocytic Leukemia (CLL)**

The efficacy of GAMMAGARD in reducing bacterial infections of B-cell CLL patients has been demonstrated in a double-blind, placebo-controlled trial of 81 subjects. Subjects were treated with 400 mg/kg/dose of GAMMAGARD or saline solution every 3 weeks for a total of 17 infusions. Forty-one subjects received GAMMAGARD and 40 subjects received saline. The infection outcomes, including the frequency of bacterial/viral/fungal infections, mean time to first bacterial infections, were compared between the two groups and are shown in Table 7.

Patients receiving GAMMAGARD had fewer infections with Streptococcus pneumoniae and Haemophilus influenzae, but the incidence of other gram negative infections was similar.
Idiopathic Thrombocytopenic Purpura (ITP)

The efficacy of GAMMAGARD has been demonstrated in a clinical study involving 16 patients: thirteen had chronic ITP (11 adults, 2 children), and 3 had acute ITP (one adult, 2 children). All 16 patients (100%) demonstrated a rise in platelet count to a level greater than 40,000/mm³ following the administration of GAMMAGARD. Ten of the 16 patients (62.5%) exhibited a platelet rise to greater than 80,000/mm³. Of these 10 patients, 7 had chronic ITP (5 adults, 2 children), and 3 had acute ITP (one adult, 2 children).

Increase in platelet count to greater than 40,000/mm³ occurred after a single 1 g/kg infusion of GAMMAGARD in 8 patients with chronic ITP (6 adults, 2 children), and in 2 patients with acute ITP (one adult, one child). A similar response was observed after two 1 g/kg infusions in 3 adult patients with chronic ITP, and one with acute ITP.

The remaining 2 adult patients with chronic ITP received more than two 1 g/kg infusions before achieving a platelet count greater than 40,000/mm³. The rise in platelet count occurred within 5 days. However, this rise was transient and not considered curative. Platelet count rises lasted 2 to 3 weeks, with a range of 12 days to 6 months. It should be noted that childhood ITP may resolve spontaneously without treatment.

Kawasaki Syndrome

The efficacy of GAMMAGARD S/D for reducing the incidence of coronary artery aneurysm in patients with Kawasaki syndrome has been demonstrated in a clinical study of 44 patients. The incidence of coronary artery aneurysm in patients with Kawasaki syndrome receiving GAMMAGARD either at a single dose of 1 g/kg (n=22) or at a dose of 400 mg/kg for four consecutive days (n=22), beginning within seven days of onset of fever, was 3/44 (6.8%). This was significantly different (p=0.008) from a comparable group of patients for four consecutive days (n=22), beginning within seven days of onset of fever, was 3/44 (6.8%). This was significantly different (p=0.008) from a comparable group of patients.

Increase in platelet count to greater than 40,000/mm³ occurred after a single 1 g/kg infusion of GAMMAGARD in 8 patients with chronic ITP (6 adults, 2 children), and in 2 patients with acute ITP (one adult, one child). A similar response was observed after two 1 g/kg infusions in 3 adult patients with chronic ITP, and one with acute ITP.

The remaining 2 adult patients with chronic ITP received more than two 1 g/kg infusions before achieving a platelet count greater than 40,000/mm³. The rise in platelet count occurred within 5 days. However, this rise was transient and not considered curative. Platelet count rises lasted 2 to 3 weeks, with a range of 12 days to 6 months. It should be noted that childhood ITP may resolve spontaneously without treatment.

</tbody>
</table>

Each bottle of GAMMAGARD S/D is furnished with a suitable volume of Sterile Water for Injection, USP, a transfer device and an administration set which contains an integral airway and a 15 micron filter.

Store GAMMAGARD S/D at a temperature not to exceed 25°C (77°F) for 24 months. Do not Freeze.

Not made with natural rubber latex.

17 PATIENT COUNSELING INFORMATION

Inform patients to immediately report the following signs and symptoms to their healthcare provider:

- Decreased urine output, sudden weight gain, fluid retention/edema, or shortness of breath [see Warnings and Precautions (5.2)].

- Instruct patients to immediately report symptoms of thrombosis. These symptoms may include pain or swelling of an arm or leg with warmth over the affected area, discoloration of an arm or leg, unexplained shortness of breath, chest pain or discomfort that worsens on deep breathing, unexplained rapid pulse, numbness or weakness on one side of the body [see Warnings and Precautions (5.3)].

- Severe headache, neck stiffness, drowsiness, fever, sensitivity to light, painful eye movements, nausea, and vomiting [see Warnings and Precautions (5.4)].

- Increased heart rate, fatigue, yellowing of the skin or eyes, and dark-colored urine [see Warnings and Precautions (5.5)].

- Trouble breathing, chest pain, blue lips or extremities, fever [see Warnings and Precautions (5.6)].

- Inform patients that GAMMAGARD S/D is made from human blood and may contain infectious agents that can cause disease agents e.g., viruses, the variant Creutzfeldt-Jakob disease (vCJD) agent and, theoretically, the Creutzfeldt-Jakob disease (CJD) agent. The risk of GAMMAGARD S/D transmitting an infectious agent has been reduced by screening plasma donors for prior exposure, testing donated plasma, and inactivating or removing certain viruses during manufacturing. Patients should report any symptoms that concern them or that might be caused by infections [see Warnings and Precautions (5.7)].

- Inform patients that GAMMAGARD S/D can interfere with their immune response to live viral vaccines such as measles, mumps, and rubella. Inform patients to notify their healthcare professional of this potential interaction when they are receiving vaccinations [see Drug Interactions (7)].

To enroll in the confidential, industry-wide Patient Notification System, call 1-888-873-2838.
