

# **ZARXIO- filgrastim-sndz injection, solution**

## **Sandoz Inc.**

-----

### **HIGHLIGHTS OF PRESCRIBING INFORMATION**

**These highlights do not include all the information needed to use ZARXIO safely and effectively. See full prescribing information for ZARXIO.**

**ZARXIO® (filgrastim-sndz) injection, for subcutaneous or intravenous use**

**Initial U.S. Approval: 2015**

**ZARXIO (filgrastim-sndz) is biosimilar\* to NEUPOGEN (filgrastim).**

### **RECENT MAJOR CHANGES**

Warnings and Precautions: Myelodysplastic Syndrome (MDS) and Acute Myeloid Leukemia (AML) (5.8) 03/2021

### **INDICATIONS AND USAGE**

ZARXIO is a leukocyte growth factor indicated to:

- Decrease the incidence of infection, as manifested by febrile neutropenia, in patients with nonmyeloid malignancies receiving myelosuppressive anti-cancer drugs associated with a significant incidence of severe neutropenia with fever (1.1)
- Reduce the time to neutrophil recovery and the duration of fever, following induction or consolidation chemotherapy treatment of patients with acute myeloid leukemia (AML) (1.2)
- Reduce the duration of neutropenia and neutropenia-related clinical sequelae, e.g., febrile neutropenia, in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation (BMT) (1.3)
- Mobilize autologous hematopoietic progenitor cells into the peripheral blood for collection by leukapheresis (1.4)
- Reduce the incidence and duration of sequelae of severe neutropenia (e.g., fever, infections, oropharyngeal ulcers) in symptomatic patients with congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia (1.5)

### **DOSAGE AND ADMINISTRATION**

- Patients with cancer receiving myelosuppressive chemotherapy or induction and/or consolidation chemotherapy for AML
  - Recommended starting dose is 5 mcg/kg/day subcutaneous injection, short intravenous infusion (15 to 30 minutes), or continuous intravenous infusion. See Full Prescribing Information for recommended dosage adjustments and timing of administration (2.1)
- Patients with cancer undergoing bone marrow transplantation
  - 10 mcg/kg/day given as an intravenous infusion no longer than 24 hours. See Full Prescribing Information for recommended dosage adjustments and timing of administration. (2.2)
- Patients undergoing autologous peripheral blood progenitor cell collection and therapy
  - 10 mcg/kg/day subcutaneous injection (2.3)
  - Administer for at least 4 days before first leukapheresis procedure and continue until last leukapheresis (2.3)
- Patients with congenital neutropenia
  - Recommended starting dose is 6 mcg/kg subcutaneous injection twice daily (2.4)
- Patients with cyclic or idiopathic neutropenia
  - Recommended starting dose is 5 mcg/kg subcutaneous injection daily (2.4)
- Direct administration of less than 0.3 mL (180 mcg) is not recommended due to potential for dosing errors (2.5)

---

## DOSAGE FORMS AND STRENGTHS

---

- Injection: 300 mcg/0.5 mL in a single-dose prefilled syringe with BD UltraSafe Passive® Needle Guard (3)
- Injection: 480 mcg/0.8 mL in a single-dose prefilled syringe with BD UltraSafe Passive® Needle Guard (3)

---

## CONTRAINDICATIONS

---

Patients with a history of serious allergic reactions to human granulocyte colony-stimulating factors such as filgrastim products or pegfilgrastim products. (4)

---

## WARNINGS AND PRECAUTIONS

---

- Fatal splenic rupture: Evaluate patients who report left upper abdominal or shoulder pain for an enlarged spleen or splenic rupture. (5.1)
- Acute respiratory distress syndrome (ARDS): Evaluate patients who develop fever and lung infiltrates or respiratory distress for ARDS. Discontinue ZARXIO in patients with ARDS. (5.2)
- Serious allergic reactions, including anaphylaxis: Permanently discontinue ZARXIO in patients with serious allergic reactions. (5.3)
- Fatal sickle cell crises: Discontinue ZARXIO if sickle cell crisis occurs. (5.4)
- Glomerulonephritis: Evaluate and consider dose-reduction or interruption of ZARXIO if causality is likely. (5.5)
- Myelodysplastic Syndrome (MDS) and Acute Myeloid Leukemia (AML): Monitor patients with breast and lung cancer using ZARXIO in conjunction with chemotherapy and/or radiotherapy for signs and symptoms of MDS/AML. (5.8)
- Thrombocytopenia: Monitor platelet counts. (5.9)

---

## ADVERSE REACTIONS

---

Most common adverse reactions in patients:

- With nonmyeloid malignancies receiving myelosuppressive anti-cancer drugs ( $\geq 5\%$  difference in incidence compared to placebo) are pyrexia, pain, rash, cough, and dyspnea. (6.1)
  - With AML ( $\geq 2\%$  difference in incidence) are pain, epistaxis and rash. (6.1)
  - With nonmyeloid malignancies undergoing myeloablative chemotherapy followed by BMT ( $\geq 5\%$  difference in incidence) is rash. (6.1)
  - Undergoing peripheral blood progenitor cell mobilization and collection ( $\geq 5\%$  incidence) are bone pain, pyrexia and headache. (6.1)
  - With severe chronic neutropenia (SCN) ( $\geq 5\%$  difference in incidence) are pain, anemia, epistaxis, diarrhea, hypoesthesia and alopecia. (6.1)
- \*Biosimilar means that the biological product is approved based on data demonstrating that it is highly similar to an FDA-approved biological product, known as a reference product, and that there are no clinically meaningful differences between the biosimilar product and the reference product. Biosimilarity of ZARXIO has been demonstrated for the condition(s) of use (e.g. indication(s), dosing regimen(s), strength(s), dosage form(s), and route(s) of administration described in its Full Prescribing Information.

To report SUSPECTED ADVERSE REACTIONS, contact Sandoz Inc. at 1-800-525-8747 or FDA at 1-800-FDA-1088 or [www.fda.gov/medwatch](http://www.fda.gov/medwatch).

**See 17 for PATIENT COUNSELING INFORMATION and FDA-approved patient labeling.**

**Revised: 3/2021**

\* Sections or subsections omitted from the full prescribing information are not listed.

---

## **FULL PRESCRIBING INFORMATION**

### **1 INDICATIONS AND USAGE**

#### **1.1 Patients with Cancer Receiving Myelosuppressive Chemotherapy**

ZARXIO is indicated to decrease the incidence of infection, as manifested by febrile neutropenia, in patients with nonmyeloid malignancies receiving myelosuppressive anti-cancer drugs associated with a significant incidence of severe neutropenia with fever [*see Clinical Studies (14.1)*].

#### **1.2 Patients with Acute Myeloid Leukemia Receiving Induction or Consolidation Chemotherapy**

ZARXIO is indicated for reducing the time to neutrophil recovery and the duration of fever, following induction or consolidation chemotherapy treatment of patients with acute myeloid leukemia (AML) [*see Clinical Studies (14.2)*].

#### **1.3 Patients with Cancer Undergoing Bone Marrow Transplantation**

ZARXIO is indicated to reduce the duration of neutropenia and neutropenia-related clinical sequelae, e.g., febrile neutropenia, in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation [*see Clinical Studies (14.3)*].

#### **1.4 Patients Undergoing Autologous Peripheral Blood Progenitor Cell Collection and Therapy**

ZARXIO is indicated for the mobilization of autologous hematopoietic progenitor cells into the peripheral blood for collection by leukapheresis [*see Clinical Studies (14.4)*].

#### **1.5 Patients with Severe Chronic Neutropenia**

ZARXIO is indicated for chronic administration to reduce the incidence and duration of sequelae of neutropenia (e.g., fever, infections, oropharyngeal ulcers) in symptomatic patients with congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia [*see Clinical Studies (14.5)*].

## 2 DOSAGE AND ADMINISTRATION

### 2.1 Dosage in Patients with Cancer Receiving Myelosuppressive Chemotherapy or Induction and/or Consolidation Chemotherapy for AML

The recommended starting dosage of ZARXIO is 5 mcg/kg/day, administered as a single daily injection by subcutaneous injection, by short intravenous infusion (15 to 30 minutes), or by continuous intravenous infusion. Obtain a complete blood count (CBC) and platelet count before instituting ZARXIO therapy and monitor twice weekly during therapy. Consider dose escalation in increments of 5 mcg/kg for each chemotherapy cycle, according to the duration and severity of the absolute neutrophil count (ANC) nadir. Recommend stopping ZARXIO if the ANC increases beyond 10,000/mm<sup>3</sup> [see *Warnings and Precautions (5.10)*].

Administer ZARXIO at least 24 hours after cytotoxic chemotherapy. Do not administer ZARXIO within the 24-hour period prior to chemotherapy [see *Warnings and Precautions (5.13)*]. A transient increase in neutrophil count is typically seen 1 to 2 days after initiation of ZARXIO therapy. Therefore, to ensure a sustained therapeutic response, administer ZARXIO daily for up to 2 weeks or until the ANC has reached 10,000/mm<sup>3</sup> following the expected chemotherapy-induced neutrophil nadir. The duration of ZARXIO therapy needed to attenuate chemotherapy-induced neutropenia may be dependent on the myelosuppressive potential of the chemotherapy regimen employed.

### 2.2 Dosage in Patients with Cancer Undergoing Bone Marrow Transplantation

The recommended dosage of ZARXIO following bone marrow transplantation (BMT) is 10 mcg/kg/day given as an intravenous infusion no longer than 24 hours. Administer the first dose of ZARXIO at least 24 hours after cytotoxic chemotherapy and at least 24 hours after bone marrow infusion. Monitor CBCs and platelet counts frequently following marrow transplantation.

During the period of neutrophil recovery, titrate the daily dosage of ZARXIO against the neutrophil response (see Table 1).

**Table 1. Recommended Dosage Adjustments During Neutrophil Recovery in Patients with Cancer Following BMT**

<b>Absolute Neutrophil Count</b>	<b>ZARXIO Dosage Adjustment</b>
When ANC greater than 1,000/mm <sup>3</sup> for 3 consecutive days	Reduce to 5 mcg/kg/day*
Then, if ANC remains greater than 1,000/mm <sup>3</sup> for 3 more consecutive days	Discontinue ZARXIO
Then, if ANC decreases to less than 1,000/mm <sup>3</sup>	Resume at 5 mcg/kg/day

\* If ANC decreases to less than 1,000/mm<sup>3</sup> at any time during the 5 mcg/kg/day administration, increase ZARXIO to 10 mcg/kg/day, and then follow the above steps.

### 2.3 Dosage in Patients Undergoing Autologous Peripheral Blood Progenitor Cell Collection and Therapy

The recommended dosage of ZARXIO for the mobilization of autologous peripheral blood progenitor cells (PBPC) is 10 mcg/kg/day given by subcutaneous injection.

Administer ZARXIO for at least 4 days before the first leukapheresis procedure and continue until the last leukapheresis. Although the optimal duration of ZARXIO administration and leukapheresis schedule have not been established, administration of filgrastim for 6 to 7 days with leukaphereses on days 5, 6, and 7 was found to be safe and effective [see *Clinical Studies (14.4)*]. Monitor neutrophil counts after 4 days of ZARXIO, and discontinue ZARXIO if the white blood cell (WBC) count rises to greater than 100,000/mm<sup>3</sup>.

## **2.4 Dosage in Patients with Severe Chronic Neutropenia**

Prior to starting ZARXIO in patients with suspected chronic neutropenia, confirm the diagnosis of severe chronic neutropenia (SCN) by evaluating serial CBCs with differential and platelet counts, and evaluating bone marrow morphology and karyotype. The use of ZARXIO prior to confirmation of a correct diagnosis of SCN may impair diagnostic efforts and may thus impair or delay evaluation and treatment of an underlying condition, other than SCN, causing the neutropenia.

The recommended starting dosage in patients with Congenital Neutropenia is 6 mcg/kg as a twice daily subcutaneous injection and the recommended starting dosage in patients with Idiopathic or Cyclic Neutropenia is 5 mcg/kg as a single daily subcutaneous injection.

### Dosage Adjustments in Patients with Severe Chronic Neutropenia

Chronic daily administration is required to maintain clinical benefit. Individualize the dosage based on the patient's clinical course as well as ANC. In the SCN postmarketing surveillance study, the reported median daily doses of filgrastim were: 6 mcg/kg (congenital neutropenia), 2.1 mcg/kg (cyclic neutropenia), and 1.2 mcg/kg (idiopathic neutropenia). In rare instances, patients with congenital neutropenia have required doses of filgrastim greater than or equal to 100 mcg/kg/day.

### Monitor CBCs for Dosage Adjustments

During the initial 4 weeks of ZARXIO therapy and during the 2 weeks following any dosage adjustment, monitor CBCs with differential and platelet counts. Once a patient is clinically stable, monitor CBCs with differential and platelet counts monthly during the first year of treatment. Thereafter, if the patient is clinically stable, less frequent routine monitoring is recommended.

## **2.5 Important Administration Instructions**

Patient self-administration and administration by a caregiver may benefit from training by a healthcare professional. Training should aim to demonstrate to those patients and caregivers how to measure the dose using the prefilled syringe, and the focus should be on ensuring that a patient or caregiver can successfully perform all of the steps in the Instructions for Use of ZARXIO prefilled syringe with BD UltraSafe Passive<sup>®</sup> Needle Guard. If a patient or caregiver is not able to demonstrate that they can measure the dose and administer the product successfully, you should consider whether the patient is an appropriate candidate for self-administration of ZARXIO [see *Instructions for Use*].

ZARXIO prefilled syringe with BD UltraSafe Passive<sup>®</sup> Needle Guard is not designed to allow for direct administration of doses of less than 0.3 mL (180 mcg). The spring-mechanism of the needle guard apparatus affixed to the prefilled syringe interferes with the visibility of the graduation markings on the syringe barrel corresponding to 0.1 mL

and 0.2 mL. The visibility of these markings is necessary to accurately measure doses of ZARXIO less than 0.3 mL (180 mcg) for direct administration to patients. Thus, the direct administration to patients requiring doses of less than 0.3 mL (180 mcg) is not recommended due to the potential for dosing errors.

ZARXIO is supplied in single-dose prefilled syringes (for subcutaneous use) [see *Dosage Forms and Strengths (3)*]. Prior to use, remove the prefilled syringe from the refrigerator and allow ZARXIO to reach room temperature for a minimum of 30 minutes and a maximum of 24 hours. Discard any prefilled syringe left at room temperature for greater than 24 hours. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration (the solution is clear and colorless to slightly yellowish). Do not administer ZARXIO if particulates or discoloration are observed.

Discard unused portion of ZARXIO in prefilled syringes. Do not save unused drug for later administration.

### Subcutaneous Injection

Inject ZARXIO subcutaneously in the outer area of upper arms, abdomen, thighs, or upper outer areas of the buttock. If patients or caregivers are to administer ZARXIO, instruct them in appropriate injection technique and ask them to follow the subcutaneous injection procedures in the Instructions for Use for the prefilled syringe [see *Patient Counseling Information (17)*].

Training by the healthcare provider should aim to demonstrate to those patients and caregivers how to measure the dose of ZARXIO, and the focus should be on ensuring that a patient or caregiver can successfully perform all the steps in the Instructions for Use for the prefilled syringe. If a patient or caregiver is not able to demonstrate that they can measure the dose and administer the product successfully, you should consider whether the patient is an appropriate candidate for self-administration of ZARXIO.

If the patient or caregiver misses a dose of ZARXIO, instruct them to contact their healthcare provider .

### Administration Instructions for the Prefilled Syringe

Persons with latex allergies should not administer the ZARXIO prefilled syringe, because the needle cap contains natural rubber latex (derived from latex).

### Dilution

If required for intravenous administration, ZARXIO may be diluted in 5% Dextrose Injection, USP to concentrations between 5 mcg/mL and 15 mcg/mL. ZARXIO diluted to concentrations from 5 mcg/mL to 15 mcg/mL should be protected from adsorption to plastic materials by the addition of Albumin (Human) to a final concentration of 2 mg/mL. When diluted in 5% Dextrose Injection, USP, or 5% Dextrose plus Albumin (Human), ZARXIO is compatible with glass, polyvinylchloride, polyolefin, and polypropylene.

**Do not dilute with saline at any time, because the product may precipitate.**

Diluted ZARXIO solution can be stored at room temperature for up to 24 hours. This 24-hour time period includes the time during room temperature storage of the infusion solution and the duration of the infusion.

### **3 DOSAGE FORMS AND STRENGTHS**

- Injection: 300 mcg/0.5 mL of a clear, colorless to slightly yellowish solution provided in a single-dose prefilled syringe with BD UltraSafe Passive® Needle Guard
- Injection: 480 mcg/0.8 mL of a clear, colorless to slightly yellowish solution provided in a single-dose prefilled syringe with BD UltraSafe Passive® Needle Guard

### **4 CONTRAINDICATIONS**

ZARXIO is contraindicated in patients with a history of serious allergic reactions to human granulocyte colony-stimulating factors such as filgrastim products or pegfilgrastim products [see *Warnings and Precautions (5.3)*].

### **5 WARNINGS AND PRECAUTIONS**

#### **5.1 Splenic Rupture**

Splenic rupture, including fatal cases, has been reported following the administration of filgrastim products. Evaluate patients who report left upper abdominal or shoulder pain for an enlarged spleen or splenic rupture.

#### **5.2 Acute Respiratory Distress Syndrome**

Acute respiratory distress syndrome (ARDS) has been reported in patients receiving filgrastim products. Evaluate patients who develop fever and lung infiltrates or respiratory distress for ARDS. Discontinue ZARXIO in patients with ARDS.

#### **5.3 Serious Allergic Reactions**

Serious allergic reactions, including anaphylaxis, have been reported in patients receiving filgrastim products. The majority of reported events occurred upon initial exposure. Provide symptomatic treatment for allergic reactions. Allergic reactions, including anaphylaxis, in patients receiving filgrastim products can recur within days after the discontinuation of initial anti-allergic treatment. Permanently discontinue ZARXIO in patients with serious allergic reactions. ZARXIO is contraindicated in patients with a history of serious allergic reactions to human granulocyte colony-stimulating factors such as filgrastim products or pegfilgrastim products.

#### **5.4 Sickle Cell Disorders**

Severe and sometimes fatal sickle cell crises can occur in patients with sickle cell disorders receiving filgrastim products. Discontinue ZARXIO if sickle cell crisis occurs.

#### **5.5 Glomerulonephritis**

Glomerulonephritis has occurred in patients receiving filgrastim products. The diagnoses were based upon azotemia, hematuria (microscopic and macroscopic), proteinuria, and renal biopsy. Generally, events of glomerulonephritis resolved after dose-reduction or discontinuation of filgrastim products. If glomerulonephritis is suspected, evaluate for cause. If causality is likely, consider dose-reduction or interruption of ZARXIO.

## 5.6 Alveolar Hemorrhage and Hemoptysis

Alveolar hemorrhage manifesting as pulmonary infiltrates and hemoptysis requiring hospitalization have been reported in healthy donors treated with filgrastim products undergoing peripheral blood progenitor cell (PBPC) collection mobilization. Hemoptysis resolved with discontinuation of filgrastim products. The use of ZARXIO for PBPC mobilization in healthy donors is not an approved indication.

## 5.7 Capillary Leak Syndrome

Capillary leak syndrome (CLS) has been reported after G-CSF administration, including filgrastim products, and is characterized by hypotension, hypoalbuminemia, edema and hemoconcentration. Episodes vary in frequency, severity and may be life-threatening if treatment is delayed. Patients who develop symptoms of capillary leak syndrome should be closely monitored and receive standard symptomatic treatment, which may include a need for intensive care.

## 5.8 Myelodysplastic Syndrome (MDS) and Acute Myeloid Leukemia (AML)

### Patients with Severe Chronic Neutropenia

Confirm the diagnosis of SCN before initiating ZARXIO therapy.

MDS and AML have been reported to occur in the natural history of congenital neutropenia without cytokine therapy. Cytogenetic abnormalities, transformation to MDS, and AML have also been observed in patients treated with filgrastim products for SCN. Based on available data including a postmarketing surveillance study, the risk of developing MDS and AML appears to be confined to the subset of patients with congenital neutropenia. Abnormal cytogenetics and MDS have been associated with the eventual development of myeloid leukemia. The effect of filgrastim products on the development of abnormal cytogenetics and the effect of continued filgrastim products administration in patients with abnormal cytogenetics or MDS are unknown. Monitor patients for signs and symptoms of MDS/AML in these settings. If a patient with SCN develops abnormal cytogenetics or myelodysplasia, the risks and benefits of continuing ZARXIO should be carefully considered.

### Patients with Breast and Lung Cancer

MDS and AML have been associated with the use of filgrastim products in conjunction with chemotherapy and/or radiotherapy in patients with breast and lung cancer. Monitor patients for signs and symptoms of MDS/AML in these settings.

## 5.9 Thrombocytopenia

Thrombocytopenia has been reported in patients receiving filgrastim products. Monitor platelet counts.

## 5.10 Leukocytosis

### Patients with Cancer Receiving Myelosuppressive Chemotherapy

White blood cell counts of  $100,000/\text{mm}^3$  or greater were observed in approximately 2% of patients receiving filgrastim at dosages above 5 mcg/kg/day. In patients with cancer receiving ZARXIO as an adjunct to myelosuppressive chemotherapy, to avoid the potential risks of excessive leukocytosis, it is recommended that ZARXIO therapy be

presentations of excessive leukocytosis, it is recommended that filgrastim therapy be discontinued if the ANC surpasses  $10,000/\text{mm}^3$  after the chemotherapy-induced ANC nadir has occurred. Monitor CBCs at least twice weekly during therapy. Dosages of ZARXIO that increase the ANC beyond  $10,000/\text{mm}^3$  may not result in any additional clinical benefit. In patients with cancer receiving myelosuppressive chemotherapy, discontinuation of filgrastim therapy usually resulted in a 50% decrease in circulating neutrophils within 1 to 2 days, with a return to pretreatment levels in 1 to 7 days.

### Peripheral Blood Progenitor Cell Collection and Therapy

During the period of administration of ZARXIO for PBPC mobilization in patients with cancer, discontinue ZARXIO if the leukocyte count rises to  $> 100,000/\text{mm}^3$ .

### **5.11 Cutaneous Vasculitis**

Cutaneous vasculitis has been reported in patients treated with filgrastim products. In most cases, the severity of cutaneous vasculitis was moderate or severe. Most of the reports involved patients with SCN receiving long-term filgrastim therapy. Hold ZARXIO therapy in patients with cutaneous vasculitis. ZARXIO may be started at a reduced dose when the symptoms resolve and the ANC has decreased.

### **5.12 Potential Effect on Malignant Cells**

ZARXIO is a growth factor that primarily stimulates neutrophils. The granulocyte colony-stimulating factor (G-CSF) receptor through which ZARXIO acts has also been found on tumor cell lines. The possibility that ZARXIO acts as a growth factor for any tumor type cannot be excluded. The safety of filgrastim products in chronic myeloid leukemia (CML) and myelodysplasia has not been established.

When ZARXIO is used to mobilize PBPC, tumor cells may be released from the marrow and subsequently collected in the leukapheresis product. The effect of reinfusion of tumor cells has not been well studied, and the limited data available are inconclusive.

### **5.13 Simultaneous Use with Chemotherapy and Radiation Therapy Not Recommended**

The safety and efficacy of ZARXIO given simultaneously with cytotoxic chemotherapy have not been established. Because of the potential sensitivity of rapidly dividing myeloid cells to cytotoxic chemotherapy, do not use ZARXIO in the period 24 hours before through 24 hours after the administration of cytotoxic chemotherapy [*see Dosage and Administration (2.2)*].

The safety and efficacy of ZARXIO have not been evaluated in patients receiving concurrent radiation therapy. Avoid the simultaneous use of ZARXIO with chemotherapy and radiation therapy.

### **5.14 Nuclear Imaging**

Increased hematopoietic activity of the bone marrow in response to growth factor therapy has been associated with transient positive bone-imaging changes. This should be considered when interpreting bone-imaging results.

### **5.15 Aortitis**

Aortitis has been reported in patients receiving filgrastim products. It may occur as early

as the first week after start of therapy. Manifestations may include generalized signs and symptoms such as fever, abdominal pain, malaise, back pain, and increased inflammatory markers (e.g., c-reactive protein and white blood cell count). Consider aortitis in patients who develop these signs and symptoms without known etiology. Discontinue ZARXIO if aortitis is suspected.

## 6 ADVERSE REACTIONS

The following serious adverse reactions are discussed in greater detail in other sections of the labeling:

- Splenic Rupture [see Warnings and Precautions (5.1)]
- Acute Respiratory Distress Syndrome [see Warnings and Precautions (5.2)]
- Serious Allergic Reactions [see Warnings and Precautions (5.3)]
- Sickle Cell Disorders [see Warnings and Precautions (5.4)]
- Glomerulonephritis [see Warnings and Precautions (5.5)]
- Alveolar Hemorrhage and Hemoptysis [see Warnings and Precautions (5.6)]
- Capillary Leak Syndrome [see Warnings and Precautions (5.7)]
- Myelodysplastic Syndrome [see Warnings and Precautions (5.8)]
- Acute Myeloid Leukemia [see Warnings and Precautions (5.8)]
- Thrombocytopenia [see Warnings and Precautions (5.9)]
- Leukocytosis [see Warnings and Precautions (5.10)]
- Cutaneous Vasculitis [see Warnings and Precautions (5.11)]
- Aortitis [see Warnings and Precautions (5.15)]

### 6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared with rates in the clinical trials of another drug and may not reflect the rates observed in clinical practice.

#### Adverse Reactions in Patients with Cancer Receiving Myelosuppressive Chemotherapy

The following adverse reaction data in Table 2 are from three randomized, placebo-controlled studies in patients with:

- small cell lung cancer receiving standard dose chemotherapy with cyclophosphamide, doxorubicin, and etoposide (Study 1)
- small cell lung cancer receiving ifosfamide, doxorubicin, and etoposide (Study 2), and
- non-Hodgkin's lymphoma (NHL) receiving doxorubicin, cyclophosphamide, vindesine, bleomycin, methylprednisolone, and methotrexate ("ACVBP") or mitoxantrone, ifosfamide, mitoguazone, teniposide, methotrexate, folinic acid, methylprednisolone, and methotrexate ("VIM3") (Study 3).

A total of 451 patients were randomized to receive subcutaneous filgrastim 230 mcg/m<sup>2</sup> (Study 1), 240 mcg/m<sup>2</sup> (Study 2) or 4 or 5 mcg/kg/day (Study 3) (n=294) or placebo (n=157). The patients in these studies were median age 61 (range 29 to 78) years and 64% were male. The ethnicity was 95% Caucasian, 4% African American, and 1% Asian.

**Table 2. Adverse Reactions in Patients with Cancer Receiving Myelosuppressive Chemotherapy (With  $\geq$  5% Higher Incidence in Filgrastim Compared to Placebo)**

<b>System Organ Class Preferred Term</b>	<b>Filgrastim (N=294)</b>	<b>Placebo (N=157)</b>
Blood and lymphatic system disorders		
Thrombocytopenia	38%	29%
Gastrointestinal disorders		
Nausea	43%	32%
General disorders and administration site conditions		
Pyrexia	48%	29%
Chest pain	13%	6%
Pain	12%	6%
Fatigue	20%	10%
Musculoskeletal and connective tissue disorders		
Back pain	15%	8%
Arthralgia	9%	2%
Bone pain	11%	6%
Pain in extremity*	7%	3%
Nervous system disorders		
Dizziness	14%	3%
Respiratory, thoracic and mediastinal disorders		
Cough	14%	8%
Dyspnea	13%	8%
Skin and subcutaneous tissue disorders		
Rash	14%	5%
Investigations		
Blood lactate dehydrogenase increased	6%	1%
Blood alkaline phosphatase increased	6%	1%

\* Percent difference (Filgrastim - Placebo) was 4%.

Adverse events with  $\geq$  5% higher incidence in filgrastim patients compared to placebo and associated with the sequelae of the underlying malignancy or cytotoxic chemotherapy delivered included anemia, constipation, diarrhea, oral pain, vomiting, asthenia, malaise, edema peripheral, hemoglobin decreased, decreased appetite, oropharyngeal pain, and alopecia.

#### Adverse Reactions in Patients with Acute Myeloid Leukemia

Adverse reaction data below are from a randomized, double-blind, placebo-controlled study in patients with AML (Study 4) who received an induction chemotherapy regimen of intravenous daunorubicin days 1, 2, and 3; cytosine arabinoside days 1 to 7; and etoposide days 1 to 5 and up to 3 additional courses of therapy (induction 2, and consolidation 1, 2) of intravenous daunorubicin, cytosine arabinoside, and etoposide. The safety population included 518 patients randomized to receive either 5 mcg/kg/day filgrastim (n=257) or placebo (n=261). The median age was 54 (range 16 to 89) years

and 54% were male.

Adverse reactions with  $\geq 2\%$  higher incidence in filgrastim patients compared to placebo included epistaxis, back pain, pain in extremity, erythema, and rash maculo-papular.

Adverse events with  $\geq 2\%$  higher incidence in filgrastim patients compared to placebo and associated with the sequelae of the underlying malignancy or cytotoxic chemotherapy included diarrhea, constipation, and transfusion reaction.

#### Adverse Reactions in Patients with Cancer Undergoing Bone Marrow Transplantation

The following adverse reaction data are from one randomized, no treatment-controlled study in patients with acute lymphoblastic leukemia or lymphoblastic lymphoma receiving high-dose chemotherapy (cyclophosphamide or cytarabine, and melphalan) and total body irradiation (Study 5) and one randomized, no treatment-controlled study in patients with Hodgkin's disease (HD) and NHL undergoing high-dose chemotherapy and autologous bone marrow transplantation (Study 6). Patients receiving autologous bone marrow transplantation only were included in the analysis. A total of 100 patients received either 30 mcg/kg/day as a 4-hour infusion (Study 5) or 10 mcg/kg/day or 30 mcg/kg/day as a 24-hour infusion (Study 6) filgrastim (n=72), no treatment control or placebo (n=28). The median age was 30 (range 15 to 57) years, 57% were male.

Adverse reactions with  $\geq 5\%$  higher incidence in filgrastim patients compared to patients receiving no filgrastim included rash and hypersensitivity.

Adverse reactions in patients receiving intensive chemotherapy followed by autologous BMT with  $\geq 5\%$  higher incidence in filgrastim patients compared to patients receiving no filgrastim included thrombocytopenia, anemia, hypertension, sepsis, bronchitis, and insomnia.

#### Adverse Reactions in Patients with Cancer Undergoing Autologous Peripheral Blood Progenitor Cell Collection

The adverse reaction data in Table 3 are from a series of 7 trials in patients with cancer undergoing mobilization of autologous peripheral blood progenitor cells for collection by leukapheresis. Patients (n=166) in all these trials underwent a similar mobilization/collection regimen: filgrastim was administered for 6 to 8 days, in most cases the apheresis procedure occurred on days 5, 6, and 7. The dosage of filgrastim ranged between 5 to 30 mcg/kg/day and was administered subcutaneously by injection or continuous infusion. The median age was 39 (range 15 to 67) years, and 48% were male.

**Table 3. Adverse Reactions in Patients with Cancer Undergoing Autologous PBPC in the Mobilization Phase ( $\geq 5\%$  Incidence in Filgrastim Patients)**

<b>System Organ Class Preferred Term</b>	<b>Mobilization Phase (N=166)</b>
Musculoskeletal and connective tissue disorders	
Bone pain	30%
General disorders and administration site conditions	
Pyrexia	16%
Investigations	
Blood alkaline phosphatase increased	11%

Nervous system disorders	
Headache	10%

### Adverse Reactions in Patients with Severe Chronic Neutropenia

The following adverse reaction data were identified in a randomized, controlled study in patients with SCN receiving filgrastim (Study 7). 123 patients were randomized to a 4-month observation period followed by subcutaneous filgrastim treatment or immediate subcutaneous filgrastim treatment. The median age was 12 years (range 7 months to 76 years) and 46% were male. The dosage of filgrastim was determined by the category of neutropenia.

Initial dosage of filgrastim:

- Idiopathic neutropenia: 3.6 mcg/kg/day
- Cyclic neutropenia: 6 mcg/kg/day
- Congenital neutropenia: 6 mcg/kg/day divided 2 times per day

The dosage was increased incrementally to 12 mcg/kg/day divided 2 times per day if there was no response. Adverse reactions with  $\geq 5\%$  higher incidence in filgrastim patients compared to patients receiving no filgrastim included arthralgia, bone pain, back pain, muscle spasms, musculoskeletal pain, pain in extremity, splenomegaly, anemia, upper respiratory tract infection, and urinary tract infection (upper respiratory tract infection and urinary tract infection were higher in the filgrastim arm, total infection related events were lower in filgrastim-treated patients), epistaxis, chest pain, diarrhea, hypoesthesia, and alopecia.

## **6.2 Immunogenicity**

As with all therapeutic proteins, there is a potential for immunogenicity. The detection of antibody formation is highly dependent on the sensitivity and specificity of the assay. Additionally, the observed incidence of antibody (including neutralizing antibody) positivity in an assay may be influenced by several factors, including assay methodology, sample handling, timing of sample collection, concomitant medications, and underlying disease. For these reasons, comparison of the incidence of antibodies in the studies described below with the incidence of antibodies in other studies or to other filgrastim products may be misleading.

The incidence of antibody development in patients receiving filgrastim products has not been adequately determined. While available data suggest that a small proportion of patients developed binding antibodies to filgrastim products, the nature and specificity of these antibodies has not been adequately studied. In clinical studies using filgrastim, the incidence of antibodies binding to filgrastim was 3% (11/333). In these 11 patients, no evidence of a neutralizing response was observed using a cell based bioassay.

Cytopenias resulting from an antibody response to exogenous growth factors have been reported on rare occasions in patients treated with other recombinant growth factors.

## **6.3 Postmarketing Experience**

The following adverse reactions have been identified during post-approval use of filgrastim products. Because these reactions are reported voluntarily from a population

of uncertain size, it is not always possible to reliably estimate their frequency or establish a causal relationship to drug exposure.

- splenic rupture and splenomegaly (enlarged spleen) [see *Warnings and Precautions (5.1)*]
- acute respiratory distress syndrome [see *Warnings and Precautions (5.2)*]
- anaphylaxis [see *Warnings and Precautions (5.3)*]
- sickle cell disorders [see *Warnings and Precautions (5.4)*]
- glomerulonephritis [see *Warnings and Precautions (5.5)*]
- alveolar hemorrhage and hemoptysis [see *Warnings and Precautions (5.6)*]
- capillary leak syndrome [see *Warnings and Precautions (5.7)*]
- leukocytosis [see *Warnings and Precautions (5.10)*]
- cutaneous vasculitis [see *Warnings and Precautions (5.11)*]
- Sweet's syndrome (acute febrile neutrophilic dermatosis)
- decreased bone density and osteoporosis in pediatric patients receiving chronic treatment with filgrastim products
- myelodysplastic syndrome (MDS) and acute myeloid leukemia (AML) in patients with breast and lung cancer receiving chemotherapy and/or radiotherapy [see *Warnings and Precautions (5.8)*]
- aortitis [see *Warnings and Precautions (5.15)*]

## **8 USE IN SPECIFIC POPULATIONS**

### **8.1 Pregnancy**

#### Risk Summary

Available data from published studies, including several observational studies of pregnancy outcomes in women exposed to filgrastim products and those who were unexposed, have not established an association with filgrastim products use during pregnancy and major birth defects, miscarriage, or adverse maternal or fetal outcomes (see *Data*). Reports in the scientific literature have described transplacental passage of filgrastim in pregnant women when administered  $\leq 30$  hours prior to preterm delivery ( $\leq 30$  weeks gestation). In animal reproduction studies, effects of filgrastim on prenatal development have been studied in rats and rabbits. No malformations were observed in either species. No maternal or fetal effects were observed in pregnant rats at doses up to 58 times the human doses. Filgrastim has been shown to have adverse effects in pregnant rabbits at doses 2 to 10 times higher than the human doses (see *Data*).

The estimated background risk of major birth defects and miscarriage for the indicated population is unknown. All pregnancies have a background risk of birth defect, loss, or other adverse outcomes. In the U.S. general population, the estimated background risks of major birth defects and miscarriage in clinically recognized pregnancies is 2-4% and 15- 20%, respectively.

#### Data

##### *Human Data*

Several observational studies based on the Severe Chronic Neutropenia International Registry (SCNIR) described pregnancy outcomes in women with severe chronic neutropenia (SCN) who were exposed to filgrastim products during pregnancy and

women with SCN who were unexposed. No major differences were seen between treated and untreated women with respect to pregnancy outcome (including miscarriage and preterm labor), newborn complications (including birth weight), and infections. Methodological limitations of these studies include small sample size and lack of generalizability due to the underlying maternal condition.

### *Animal Data*

Effects of filgrastim on prenatal development have been studied in rats and rabbits. No malformations were observed in either species. Filgrastim has been shown to have adverse effects in pregnant rabbits at doses 2 to 10 times higher than the human doses. In pregnant rabbits showing signs of maternal toxicity, reduced embryo-fetal survival (at 20 and 80 mcg/kg/day) and increased abortions (at 80 mcg/kg/day) were observed. In pregnant rats, no maternal or fetal effects were observed at doses up to 575 mcg/kg/day, which is approximately 58 times higher than the human dose of 10 mcg/kg/day.

Offspring of rats administered filgrastim during the peri-natal and lactation periods exhibited a delay in external differentiation and growth retardation ( $\geq 20$  mcg/kg/day) and slightly reduced survival rate (100 mcg/kg/day).

## **8.2 Lactation**

### Risk Summary

There is published literature documenting transfer of filgrastim into human milk. There are a few case reports describing the use of filgrastim in breastfeeding mothers with no adverse effects noted in the infants. There are no data on the effects of filgrastim products on milk production. Other filgrastim products are secreted poorly into breast milk, and filgrastim products are not absorbed orally by neonates. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for ZARXIO and any potential adverse effects on the breastfed child from ZARXIO or from the underlying maternal condition.

## **8.4 Pediatric Use**

ZARXIO prefilled syringe with BD UltraSafe Passive<sup>®</sup> Needle Guard may not accurately measure volumes less than 0.3 mL due to the needle spring mechanism design. Therefore, the direct administration of a volume less than 0.3 mL (180 mcg) is not recommended due to the potential for dosing errors.

In patients with cancer receiving myelosuppressive chemotherapy, 15 pediatric patients median age 2.6 (range 1.2 to 9.4) years with neuroblastoma were treated with myelosuppressive chemotherapy (cyclophosphamide, cisplatin, doxorubicin, and etoposide) followed by subcutaneous filgrastim at doses of 5, 10, or 15 mcg/kg/day for 10 days (n=5/dose) (Study 8). The pharmacokinetics of filgrastim in pediatric patients after chemotherapy were similar to those in adults receiving the same weight-normalized doses, suggesting no age-related differences in the pharmacokinetics of filgrastim. In this population, filgrastim was well tolerated. There was one report of palpable splenomegaly and one report of hepatosplenomegaly associated with filgrastim therapy; however, the only consistently reported adverse event was musculoskeletal pain, which is no different from the experience in the adult population.

The safety and effectiveness of filgrastim have been established in pediatric patients with

SCN [see *Clinical Studies (14.5)*]. In a phase 3 study (Study 7) to assess the safety and efficacy of filgrastim in the treatment of SCN, 123 patients with a median age of 12 years (range 7 months to 76 years) were studied. Of the 123 patients, 12 were infants (7 months to 2 years of age), 49 were children (2 to 12 years of age), and 9 were adolescents (12 to 16 years of age). Additional information is available from a SCN postmarketing surveillance study, which includes long-term follow-up of patients in the clinical studies and information from additional patients who entered directly into the postmarketing surveillance study. Of the 731 patients in the surveillance study, 429 were pediatric patients < 18 years of age (range 0.9 to 17) [see *Indications and Usage (1.5)*, *Dosage and Administration (2.5)*, and *Clinical Studies (14.5)*].

Long-term follow-up data from the postmarketing surveillance study suggest that height and weight are not adversely affected in patients who received up to 5 years of filgrastim treatment. Limited data from patients who were followed in the phase 3 study for 1.5 years did not suggest alterations in sexual maturation or endocrine function.

Pediatric patients with congenital types of neutropenia (Kostmann's syndrome, congenital agranulocytosis, or Schwachman-Diamond syndrome) have developed cytogenetic abnormalities and have undergone transformation to MDS and AML while receiving chronic filgrastim treatment. The relationship of these events to filgrastim administration is unknown [see *Warnings and Precautions (5.8)* and *Adverse Reactions (6)*].

## **8.5 Geriatric Use**

Among 855 subjects enrolled in 3 randomized, placebo-controlled trials of filgrastim treated-patients receiving myelosuppressive chemotherapy, there were 232 subjects age 65 or older, and 22 subjects age 75 or older. No overall differences in safety or effectiveness were observed between these subjects and younger subjects. Clinical studies of filgrastim in other approved indications (i.e., BMT recipients, PBPC mobilization, and SCN) did not include sufficient numbers of subjects aged 65 and older to determine whether elderly subjects respond differently from younger subjects.

## **10 OVERDOSAGE**

The maximum tolerated dose of filgrastim products has not been determined. In filgrastim clinical trials of patients with cancer receiving myelosuppressive chemotherapy, WBC counts > 100,000/mm<sup>3</sup> have been reported in less than 5% of patients, but were not associated with any reported adverse clinical effects. Patients in the BMT studies received up to 138 mcg/kg/day without toxic effects, although there was a flattening of the dose response curve above daily doses of greater than 10 mcg/kg/day.

## **11 DESCRIPTION**

Filgrastim-sndz is a 175 amino acid human granulocyte colony-stimulating factor (G-CSF) manufactured by recombinant DNA technology.

ZARXIO is produced by *Escherichia coli* (*E coli*) bacteria into which has been inserted the human granulocyte colony-stimulating factor gene. ZARXIO has a molecular weight of 18,800 daltons. The protein has an amino acid sequence that is identical to the natural

sequence predicted from human DNA sequence analysis, except for the addition of an N-terminal methionine necessary for expression in *E coli*. Because ZARXIO is produced in *E coli*, the product is non-glycosylated and thus differs from G-CSF isolated from a human cell.

ZARXIO injection is a sterile, clear, colorless to slightly yellowish, preservative-free liquid containing filgrastim-sndz at a specific activity of  $1.0 \times 10^8$  U/mg (as measured by a cell mitogenesis assay). The product is available in single-dose prefilled syringes. The single-dose prefilled syringes contain either 300 mcg/0.5 mL or 480 mcg/0.8 mL of filgrastim-sndz. See Table 4 below for product composition of each single-dose prefilled syringe.

**Table 4. Product Composition**

	<b>300 mcg/0.5 mL Syringe</b>	<b>480 mcg/0.8 mL Syringe</b>
Filgrastim-sndz	300 mcg	480 mcg
Glutamic Acid	0.736 mg	1.178 mg
Polysorbate 80	0.02 mg	0.032 mg
Sorbitol	25 mg	40 mg
Sodium hydroxide	q.s.	q.s.
Water for Injection USP q.s. ad*	ad 0.5 mL	ad 0.8 mL

\*quantity sufficient to make.

## **12 CLINICAL PHARMACOLOGY**

### **12.1 Mechanism of Action**

Colony-stimulating factors are glycoproteins which act on hematopoietic cells by binding to specific cell surface receptors and stimulating proliferation, differentiation commitment, and some end-cell functional activation.

Endogenous G-CSF is a lineage-specific colony-stimulating factor that is produced by monocytes, fibroblasts, and endothelial cells. G-CSF regulates the production of neutrophils within the bone marrow and affects neutrophil progenitor proliferation, differentiation, and selected end-cell functions (including enhanced phagocytic ability, priming of the cellular metabolism associated with respiratory burst, antibody-dependent killing, and the increased expression of some cell surface antigens). G-CSF is not species-specific and has been shown to have minimal direct *in vivo* or *in vitro* effects on the production or activity of hematopoietic cell types other than the neutrophil lineage.

### **12.2 Pharmacodynamics**

In phase 1 studies involving 96 patients with various nonmyeloid malignancies, administration of filgrastim resulted in a dose-dependent increase in circulating neutrophil counts over the dose range of 1 to 70 mcg/kg/day. This increase in neutrophil counts was observed whether filgrastim was administered intravenous (1 to 70 mcg/kg twice daily), subcutaneous (1 to 3 mcg/kg once daily), or by continuous subcutaneous infusion (3 to 11 mcg/kg/day). With discontinuation of filgrastim therapy, neutrophil

counts returned to baseline in most cases within 4 days. Isolated neutrophils displayed normal phagocytic (measured by zymosan-stimulated chemiluminescence) and chemotactic (measured by migration under agarose using N-formyl-methionyl-leucyl-phenylalanine [fMLP] as the chemotaxin) activity *in vitro*.

The absolute monocyte count was reported to increase in a dose-dependent manner in most patients receiving filgrastim; however, the percentage of monocytes in the differential count remained within the normal range. Absolute counts of both eosinophils and basophils did not change and were within the normal range following administration of filgrastim. Increases in lymphocyte counts following filgrastim administration have been reported in some normal subjects and patients with cancer.

White blood cell (WBC) differentials obtained during clinical trials have demonstrated a shift towards earlier granulocyte progenitor cells (left shift), including the appearance of promyelocytes and myeloblasts, usually during neutrophil recovery following the chemotherapy-induced nadir. In addition, Dohle bodies, increased granulocyte granulation, and hypersegmented neutrophils have been observed. Such changes were transient and were not associated with clinical sequelae, nor were they necessarily associated with infection.

### **12.3 Pharmacokinetics**

Filgrastim products exhibit nonlinear pharmacokinetics. Clearance is dependent on filgrastim product concentration and neutrophil count: G-CSF receptor-mediated clearance is saturated by high concentration of filgrastim products and is diminished by neutropenia. In addition, filgrastim products are cleared by the kidney.

Subcutaneous administration of 3.45 mcg/kg and 11.5 mcg/kg of filgrastim resulted in maximum serum concentrations of 4 and 49 ng/mL, respectively, within 2 to 8 hours. After intravenous administration, the volume of distribution averaged 150 mL/kg and the elimination half-life was approximately 3.5 hours in both normal subjects and subjects with cancer. Clearance rates of filgrastim were approximately 0.5 to 0.7 mL/minute/kg. Single parenteral doses or daily intravenous doses, over a 14-day period, resulted in comparable half-lives. The half-lives were similar for intravenous administration (231 minutes, following doses of 34.5 mcg/kg) and for subcutaneous administration (210 minutes, following filgrastim dosages of 3.45 mcg/kg). Continuous 24-hour intravenous infusions of 20 mcg/kg over an 11 to 20-day period produced steady-state serum concentrations of filgrastim with no evidence of drug accumulation over the time period investigated. The absolute bioavailability of filgrastim after subcutaneous administration is 60% to 70%.

#### *Specific Populations*

##### Pediatric Patients

The pharmacokinetics of filgrastim in pediatric patients after chemotherapy are similar to those in adult patients receiving the same weight-normalized doses, suggesting no age-related differences in the pharmacokinetics of filgrastim products [see *Use in Specific Populations (8.4)*].

##### Renal Impairment

In a study with healthy volunteers, subjects with moderate renal impairment, and subjects with end stage renal disease (n=4 per group), higher serum concentrations

were observed in subjects with end-stage renal disease. However, dose adjustment in patients with renal impairment is not necessary.

### Hepatic Impairment

Pharmacokinetics and pharmacodynamics of filgrastim are similar between subjects with hepatic impairment and healthy subjects (n=12/group). The study included 10 subjects with mild hepatic impairment (Child-Pugh Class A) and 2 subjects with moderate hepatic impairment (Child-Pugh Class B). Therefore, dose adjustment for ZARXIO in patients with hepatic impairment is not necessary.

## **13 NONCLINICAL TOXICOLOGY**

### **13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility**

The carcinogenic potential of filgrastim products has not been studied. Filgrastim failed to induce bacterial gene mutations in either the presence or absence of a drug metabolizing enzyme system. Filgrastim had no observed effect on the fertility of male or female rats at doses up to 500 mcg/kg.

### **13.2 Animal Toxicology and Pharmacology**

Filgrastim was administered to monkeys, dogs, hamsters, rats, and mice as part of a nonclinical toxicology program, which included studies up to 1-year duration.

In the repeated-dose studies, changes observed were attributable to the expected pharmacological actions of filgrastim (i.e., dose-dependent increases in white blood cell counts, increased circulating segmented neutrophils, and increased myeloid: erythroid ratio in bone marrow). Histopathologic examination of the liver and spleen revealed evidence of ongoing extramedullary granulopoiesis, and dose-related increases in spleen weight were seen in all species. These changes all reversed after discontinuation of treatment.

## **14 CLINICAL STUDIES**

### **14.1 Patients with Cancer Receiving Myelosuppressive Chemotherapy**

The safety and efficacy of filgrastim to decrease the incidence of infection, as manifested by febrile neutropenia, in patients with nonmyeloid malignancies receiving myelosuppressive anti-cancer drugs were established in a randomized, double-blind, placebo-controlled trial conducted in patients with small cell lung cancer (Study 1).

In Study 1, patients received up to 6 cycles of intravenous chemotherapy including intravenous cyclophosphamide and doxorubicin on day 1; and etoposide on days 1, 2, and 3 of 21 day cycles. Patients were randomized to receive filgrastim (n=99) at a dose of 230 mcg/m<sup>2</sup> (4 to 8 mcg/kg/day) or placebo (n=111). Study drug was administered subcutaneously daily beginning on day 4, for a maximum of 14 days. A total of 210 patients were evaluable for efficacy and 207 were evaluable for safety. The demographic and disease characteristics were balanced between arms with a median age of 62 (range 31 to 80) years; 64% males; 89% Caucasian; 72% extensive disease and 28% limited disease.

The main efficacy endpoint was the incidence of febrile neutropenia. Febrile neutropenia was defined as an ANC < 1,000/mm<sup>3</sup> and temperature > 38.2°C. Treatment with filgrastim resulted in a clinically and statistically significant reduction in the incidence of infection, as manifested by febrile neutropenia, 40% for filgrastim-treated patients and 76% for placebo-treated patients (p < 0.001). There were also statistically significant reductions in the incidence and overall duration of infection manifested by febrile neutropenia; the incidence, severity and duration of severe neutropenia (ANC < 500/mm<sup>3</sup>); the incidence and overall duration of hospital admissions; and the number of reported days of antibiotic use.

#### **14.2 Patients with Acute Myeloid Leukemia Receiving Induction or Consolidation Chemotherapy**

The safety and efficacy of filgrastim to reduce the time to neutrophil recovery and the duration of fever, following induction or consolidation chemotherapy treatment of patients with acute myeloid leukemia (AML) was established in a randomized, double-blind, placebo-controlled, multi-center trial in patients with newly diagnosed, *de novo* AML (Study 4).

In Study 4 the initial induction therapy consisted of intravenous daunorubicin days 1, 2, and 3; cytosine arabinoside days 1 to 7; and etoposide days 1 to 5. Patients were randomized to receive subcutaneous filgrastim (n=259) at a dose of 5 mcg/kg/day or placebo (n=262) from 24 hours after the last dose of chemotherapy until neutrophil recovery (ANC ≥1,000/mm<sup>3</sup> for 3 consecutive days or ≥ 10,000/mm<sup>3</sup> for 1 day) or for a maximum of 35 days. The demographic and disease characteristics were balanced between arms with a median age of 54 (range 16 to 89) years; 54% males; initial white blood cell count (65% <25,000 /mm<sup>3</sup> and 27% > 100,000/mm<sup>3</sup>); 29% unfavorable cytogenetics.

The main efficacy endpoint was median duration of severe neutropenia defined as neutrophil count < 500/mm<sup>3</sup>. Treatment with filgrastim resulted in a clinically and statistically significant reduction in median number of days of severe neutropenia, filgrastim-treated patients 14 days, placebo-treated patients 19 days (p=0.0001: difference of 5 days (95% CI: -6.0, -4.0)). There was a reduction in the median duration of intravenous antibiotic use, filgrastim-treated patients: 15 days versus placebo-treated patients: 18.5 days; a reduction in the median duration of hospitalization, filgrastim-treated patients: 20 days versus placebo-treated patients: 25 days.

There were no statistically significant differences between the filgrastim and the placebo groups in complete remission rate (69% - filgrastim, 68% - placebo), median time to progression of all randomized patients (165 days - filgrastim, 186 days - placebo), or median overall survival (380 days - filgrastim, 425 days - placebo).

#### **14.3 Patients with Cancer Undergoing Bone Marrow Transplantation**

The safety and efficacy of filgrastim to reduce the duration of neutropenia in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by autologous bone marrow transplantation was evaluated in 2 randomized controlled trials of patients with lymphoma (Study 6 and Study 9). The safety and efficacy of filgrastim to reduce the duration of neutropenia in patients undergoing myeloablative chemotherapy followed by allogeneic bone marrow transplantation was evaluated in a randomized placebo-controlled trial (Study 10).

In Study 6, patients with Hodgkin's disease received a preparative regimen of intravenous cyclophosphamide, etoposide, and BCNU ("CVP"), and patients with non-Hodgkin's lymphoma received intravenous BCNU, etoposide, cytosine arabinoside and melphalan ("BEAM"). There were 54 patients randomized 1:1:1 to control, filgrastim 10 mcg/kg/day, and filgrastim 30 mcg/kg/day as a 24-hour continuous infusion starting 24-hours after bone marrow infusion for a maximum of 28 days. The median age was 33 (range 17 to 57) years; 56% males; 69% Hodgkin's disease and 31% non-Hodgkin's lymphoma.

The main efficacy endpoint was duration of severe neutropenia  $ANC < 500/mm^3$ . A statistically significant reduction in the median number of days of severe neutropenia ( $ANC < 500/mm^3$ ) occurred in the filgrastim-treated groups versus the control group (23 days in the control group, 11 days in the 10 mcg/kg/day group, and 14 days in the 30 mcg/kg/day group [11 days in the combined treatment groups,  $p=0.004$ ]).

In Study 9, patients with Hodgkin's disease and non-Hodgkin's lymphoma received a preparative regimen of intravenous cyclophosphamide, etoposide, and BCNU ("CVP"). There were 43 evaluable patients randomized to continuous subcutaneous infusion filgrastim 10 mcg/kg/day ( $n=19$ ), filgrastim 30 mcg/kg/day ( $n=10$ ) and no treatment ( $n=14$ ) starting the day after marrow infusion for a maximum of 28 days. The median age was 33 (range 17 to 56) years; 67% males; 28% Hodgkin's disease and 72% non-Hodgkin's lymphoma.

The main efficacy endpoint was duration of severe neutropenia. There was statistically significant reduction in the median number of days of severe neutropenia ( $ANC < 500/mm^3$ ) in the filgrastim-treated groups versus the control group (21.5 days in the control group versus 10 days in the filgrastim-treated groups,  $p < 0.001$ ). The number of days of febrile neutropenia was also reduced significantly in this study (13.5 days in the control group versus 5 days in the filgrastim-treated groups,  $p < 0.0001$ ).

In Study 10, 70 patients scheduled to undergo bone marrow transplantation for multiple underlying conditions using multiple preparative regimens were randomized to receive filgrastim 300 mcg/m<sup>2</sup>/day ( $n=33$ ) or placebo ( $n=37$ ) days 5 through 28 after marrow infusion. The median age was 18 (range 1 to 45) years, 56% males. The underlying disease was: 67% hematologic malignancy, 24% aplastic anemia, 9% other. A statistically significant reduction in the median number of days of severe neutropenia occurred in the treated group versus the control group (19 days in the control group and 15 days in the treatment group,  $p < 0.001$ ) and time to recovery of  $ANC \geq 500/mm^3$  (21 days in the control group and 16 days in the treatment group,  $p < 0.001$ ).

#### **14.4 Patients Undergoing Autologous Peripheral Blood Progenitor Cell Collection and Therapy**

The safety and efficacy of filgrastim to mobilize autologous peripheral blood progenitor cells for collection by leukapheresis was supported by the experience in uncontrolled trials, and a randomized trial comparing hematopoietic stem cell rescue using filgrastim-mobilized autologous peripheral blood progenitor cells to autologous bone marrow (Study 11). Patients in all these trials underwent a similar mobilization/collection regimen: filgrastim was administered for 6 to 7 days, in most cases the apheresis procedure occurred on days 5, 6, and 7. The dose of filgrastim ranged between 10 to 24 mcg/kg/day and was administered subcutaneously by injection or continuous intravenous infusion.

Engraftment was evaluated in 64 patients who underwent transplantation using filgrastim-mobilized autologous hematopoietic progenitor cells in uncontrolled trials. Two of the 64 patients (3%) did not achieve the criteria for engraftment as defined by a platelet count  $\geq 20,000/\text{mm}^3$  by day 28. In clinical trials of filgrastim for the mobilization of hematopoietic progenitor cells, filgrastim was administered to patients at doses between 5 to 24 mcg/kg/day after reinfusion of the collected cells until a sustainable ANC ( $\geq 500/\text{mm}^3$ ) was reached. The rate of engraftment of these cells in the absence of filgrastim post transplantation has not been studied.

Study 11 was a randomized, unblinded study of patients with Hodgkin's disease or non-Hodgkin's lymphoma undergoing myeloablative chemotherapy, 27 patients received filgrastim-mobilized autologous hematopoietic progenitor cells and 31 patients received autologous bone marrow. The preparative regimen was intravenous BCNU, etoposide, cytosine arabinoside and melphalan ("BEAM"). Patients received daily filgrastim 24 hours after stem cell infusion at a dose of 5 mcg/kg/day. The median age was 33 (range 1 to 59) years; 64% males; 57% Hodgkin's disease and 43% non-Hodgkin's lymphoma. The main efficacy endpoint was number of days of platelet transfusions. Patients randomized to filgrastim-mobilized autologous peripheral blood progenitor cells compared to autologous bone marrow had significantly fewer days of platelet transfusions (median 6 vs 10 days).

#### **14.5 Patients with Severe Chronic Neutropenia**

The safety and efficacy of filgrastim to reduce the incidence and duration of sequelae of neutropenia (that is fever, infections, oropharyngeal ulcers) in symptomatic adult and pediatric patients with congenital neutropenia, cyclic neutropenia, or idiopathic neutropenia was established in a randomized controlled trial conducted in patients with severe neutropenia (Study 7).

Patients eligible for Study 7 had a history of severe chronic neutropenia documented with an ANC  $< 500/\text{mm}^3$  on three occasions during a 6-month period, or in patients with cyclic neutropenia 5 consecutive days of ANC  $< 500/\text{mm}^3$  per cycle. In addition, patients must have experienced a clinically significant infection during the previous 12 months. Patients were randomized to a 4-month observation period followed by filgrastim treatment or immediate filgrastim treatment. The median age was 12 years (range 7 months to 76 years); 46% males; 34% idiopathic, 17% cyclic and 49% congenital neutropenia. Filgrastim was administered subcutaneously. The dose of filgrastim was determined by the category of neutropenia.

Initial dose of filgrastim:

- Idiopathic neutropenia: 3.6 mcg/kg/day
- Cyclic neutropenia: 6 mcg/kg/day
- Congenital neutropenia: 6 mcg/kg/day divided 2 times per day

The dose was increased incrementally to 12 mcg/kg/day divided 2 times per day if there was no response.

The main efficacy endpoint was response to filgrastim treatment. ANC response from baseline ( $< 500/\text{mm}^3$ ) was defined as follows:

- Complete response: median ANC  $> 1,500/\text{mm}^3$
- Partial response: median ANC  $\geq 500/\text{mm}^3$  and  $\leq 1,500/\text{mm}^3$  with a minimum

- increase of 100%
- No response: median ANC < 500/mm<sup>3</sup>

There were 112 of 123 patients who demonstrated a complete or partial response to filgrastim treatment.

Additional efficacy endpoints included a comparison between patients randomized to 4 months of observation and patients receiving filgrastim of the following parameters:

- incidence of infection
- incidence of fever
- duration of fever
- incidence, duration, and severity of oropharyngeal ulcers
- number of days of antibiotic use

The incidence for each of these 5 clinical parameters was lower in the filgrastim arm compared to the control arm for cohorts in each of the 3 major diagnostic categories. An analysis of variance showed no significant interaction between treatment and diagnosis, suggesting that efficacy did not differ substantially in the different diseases. Although filgrastim substantially reduced neutropenia in all patient groups, in patients with cyclic neutropenia, cycling persisted but the period of neutropenia was shortened to 1 day.

## **16 HOW SUPPLIED/STORAGE AND HANDLING**

Injection: Single-dose, preservative-free, prefilled syringes with an UltraSafe Passive<sup>®</sup> Needle Guard, containing 300 mcg/0.5 mL of a clear, colorless to slightly yellowish filgrastim-sndz solution.

- Pack of 1 prefilled syringe (NDC 61314-318-01)
- Pack of 10 (multipack) prefilled syringes (NDC 61314-318-10)

Injection: Single-dose, preservative-free, prefilled syringes with an UltraSafe Passive<sup>®</sup> Needle Guard, containing 480 mcg/0.8 mL of a clear, colorless to slightly yellowish filgrastim-sndz solution.

- Pack of 1 prefilled syringe (NDC 61314-326-01)
- Pack of 10 (multipack) prefilled syringes (NDC 61314-326-10)

Latex-sensitive individuals: The removable needle cap of ZARXIO prefilled syringe contains natural rubber latex which may cause allergic reaction. The safe use of ZARXIO in latex-sensitive individuals has not been studied.

### Storage:

Store in the refrigerator at 2°C to 8°C (36°F to 46°F) in the original pack to protect from light. Avoid shaking. Protect from freezing. Prior to injection, ZARXIO may be allowed to reach room temperature for a maximum of 24 hours. Any prefilled syringe left above 25°C (77°F) for greater than 24 hours should be discarded.

Avoid freezing; if frozen, thaw in the refrigerator before administration. Discard ZARXIO if frozen more than once.

## 17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information and Instructions for Use). Review the steps for direct patient administration with patients and caregivers. Training by the healthcare provider should aim to ensure that patients and caregivers can successfully perform all of the steps in the Instructions for Use of ZARXIO prefilled syringe, including showing the patient or caregiver how to measure the required dose, particularly if a patient is on a dose other than the entire prefilled syringe. If a patient or caregiver is not able to demonstrate that they can measure the dose and administer the product successfully, you should consider whether the patient is an appropriate candidate for self-administration of ZARXIO.

Advise patients of the following risks and potential risks with ZARXIO:

- Rupture or enlargement of the spleen may occur. Symptoms include left upper quadrant abdominal pain or left shoulder pain. Advise patients to report pain in these areas to their physician immediately [see *Warnings and Precautions (5.1)*].
- Dyspnea, with or without fever, progressing to Acute Respiratory Distress Syndrome, may occur. Advise patients to report dyspnea to their physician immediately [see *Warnings and Precautions (5.2)*].
- Serious allergic reactions may occur, which may be signaled by rash, facial edema, wheezing, dyspnea, hypotension, or tachycardia. Advise patients to seek immediate medical attention if signs or symptoms of hypersensitivity reaction occur [see *Warnings and Precautions (5.3)*].
- In patients with sickle cell disease, sickle cell crisis and death have occurred. Discuss potential risks and benefits for patients with sickle cell disease prior to the administration of human granulocyte colony-stimulating factors [see *Warnings and Precautions (5.4)*].
- Glomerulonephritis may occur. Symptoms include swelling of the face or ankles, dark colored urine or blood in the urine, or a decrease in urine production. Advise patients to report signs or symptoms of glomerulonephritis to their physician immediately [see *Warnings and Precautions (5.5)*].
- There may be an increased risk of Myelodysplastic Syndrome and/or Acute Myeloid Leukemia in patients with congenital neutropenia who receive filgrastim and in patients with breast and lung cancer who receive filgrastim in conjunction with chemotherapy and/or radiation therapy. Symptoms of MDS and AML may include tiredness, fever, and easy bruising or bleeding. Advise patients to report to their physician signs and symptoms of MDS/AML [see *Warnings and Precautions (5.8)*].
- Cutaneous vasculitis may occur, which may be signaled by purpura or erythema. Advise patients to report signs or symptoms of vasculitis to their physician immediately [see *Warnings and Precautions (5.11)*].
- Aortitis may occur. Symptoms may include fever, abdominal pain, malaise, back pain, and increased inflammatory markers. Advise patients to report signs and symptoms of aortitis to their physician immediately [see *Warnings and Precautions (5.15)*].

Instruct patients who self-administer ZARXIO using the prefilled syringe of the:

- Importance of following the applicable Instructions for Use.
- Dangers of reusing needles, and syringes.
- Importance of following local requirements for proper disposal of used syringes.

- Importance of informing the healthcare provider if difficulty occurs when measuring or administering partial contents of the ZARXIO prefilled syringe.

## Patient Information

**ZARXIO® (zar-zee-oh)**

**(filgrastim-sndz)**

**injection**

### **What is ZARXIO?**

ZARXIO is a man-made form of granulocyte colony-stimulating factor (G-CSF). G-CSF is a substance produced by the body. It stimulates the growth of neutrophils, a type of white blood cell important in the body's fight against infection.

**Do not take ZARXIO** if you have had a serious allergic reaction to human G-CSFs such as filgrastim products or pegfilgrastim products.

**Before you take ZARXIO, tell your healthcare provider about all of your medical conditions, including if you:**

- have a sickle cell disorder.
- have kidney problems.
- are receiving radiation therapy.
- are allergic to latex. The needle cap on the prefilled syringe contains dry natural rubber (derived from latex). You should not give ZARXIO using the prefilled syringe if you have latex allergies.
- are pregnant or plan to become pregnant. It is not known if ZARXIO will harm your unborn baby.
- are breastfeeding or plan to breastfeed. It is not known if ZARXIO passes into your breast milk.

**Tell your healthcare provider about all the medicines you take**, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

**How will I receive ZARXIO?**

- **ZARXIO injections can be given by a healthcare provider by intravenous (IV) infusion or under your skin (subcutaneous injection). Your healthcare provider may decide subcutaneous injections can be given at home by you or your caregiver. If ZARXIO is given at home, see the detailed “Instructions for Use” that comes with your ZARXIO for information on how to prepare and inject a dose of ZARXIO.**
- You and your caregiver should be shown how to prepare and inject ZARXIO before you use it by your healthcare provider.
- Your healthcare provider will tell you how much ZARXIO to inject and when to inject it. Do not change your dose or stop ZARXIO unless your healthcare provider tells you to.
- You should not inject a dose of ZARXIO less than 0.3 mL (180 mcg) from a ZARXIO prefilled syringe. A dose less than 0.3 mL cannot be accurately measured using the ZARXIO prefilled syringe.
- If you are receiving ZARXIO because you are also receiving chemotherapy, your dose of ZARXIO should be injected **at least 24 hours before** or **24 hours after** your dose of chemotherapy. Your healthcare provider will do blood tests to monitor your white blood cell count, and if necessary, adjust your ZARXIO dose.
- If you miss a dose of ZARXIO, talk to your healthcare provider about when you should give your next dose.

**What are the possible side effects of ZARXIO? ZARXIO may cause serious side effects, including:**

- **Spleen rupture.** Your spleen may become enlarged and can rupture. A ruptured spleen can cause death. Call your healthcare provider right away if you have pain in the left upper stomach (abdomen) area or your left shoulder.
- **A serious lung problem called acute respiratory distress syndrome (ARDS).** Call your healthcare provider or get emergency medical help right away if you have shortness of breath with or without a fever, trouble breathing, or a fast rate of breathing.
- **Serious allergic reactions.** ZARXIO can cause serious allergic reactions. These reactions can cause a rash over your whole body, shortness of breath, wheezing, dizziness, swelling around your mouth or eyes, fast heart rate, and sweating. If you have any of these symptoms, stop using ZARXIO and call your healthcare provider or get emergency medical help right away.
- **Sickle cell crises.** You may have a serious sickle cell crisis, which could lead to death, if you have a sickle cell disorder and receive ZARXIO. Call your healthcare provider right away if you have symptoms of sickle cell crisis such as pain or difficulty breathing.
- **Kidney injury (glomerulonephritis).** ZARXIO can cause kidney injury. Call your healthcare provider right away if you develop any of the following symptoms:
  - o swelling of your face or ankles,
  - o blood in your urine or dark colored urine
  - o you urinate less than usual.
- **Capillary leak syndrome.** ZARXIO can cause fluid to leak from blood vessels into your body’s tissues. This condition is called “Capillary Leak Syndrome” (CLS). CLS can quickly cause you to have symptoms that may become life-threatening. Get emergency medical help right away if you develop any of the following symptoms:

- o swelling or puffiness and are urinating less than usual
- o trouble breathing
- o swelling of your stomach area (abdomen) and feeling of fullness
- o dizziness or feeling faint
- o a general feeling of tiredness

- **Myelodysplastic syndrome (MDS) and acute myeloid leukemia (AML).**

- o ZARXIO may increase the risk of developing a precancerous condition called MDS or a type of blood cancer called AML in people who were born with low white blood cell counts (congenital neutropenia).
- o If you have breast cancer or lung cancer, when ZARXIO is used with chemotherapy and radiation therapy, or with radiation therapy only, you may have an increased risk of developing MDS or AML.
- o Symptoms of MDS and AML may include tiredness, fever, and easy bruising or bleeding.
- o Call your healthcare provider if you develop any of these symptoms during treatment with ZARXIO.

- **Decreased platelet count (thrombocytopenia).** Your healthcare provider will check your blood during treatment with ZARXIO. Tell your healthcare provider if you have unusual bleeding or bruising during treatment with ZARXIO. This could be a sign of decreased platelet counts, which may reduce the ability of your blood to clot.
- **Increased white blood cell count (leukocytosis).** Your healthcare provider will check your blood during treatment with ZARXIO.
- **Inflammation of your blood vessels (cutaneous vasculitis).** Tell your healthcare provider right away if you develop purple spots or redness of your skin.
- **Inflammation of the aorta (aortitis).** Inflammation of the aorta (the large blood vessel which transports blood from the heart to the body) has been reported in patients who received filgrastim products. Symptoms may include fever, abdominal pain, feeling tired, and back pain. Call your healthcare provider if you experience these symptoms.

The most common side effects experienced in patients receiving ZARXIO include:

- o Patients with cancer receiving chemotherapy: fever, pain, rash, cough, and shortness of breath
- o Patients with acute myeloid leukemia receiving chemotherapy: pain, nose bleed, and rash
- o Patients with cancer receiving chemotherapy followed by bone marrow transplant: rash
- o Patients who are having their own blood cells collected: bone pain, fever, and headache
- o Patients with severe chronic neutropenia: pain, decreased red blood cells, nose bleed, diarrhea, reduced sensation, and hair loss

These are not all the possible side effects of ZARXIO.

Call your healthcare provider for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

## How should I store ZARXIO?

- Store ZARXIO in the refrigerator between 36°F to 46°F (2°C to 8°C).
- Do **not** freeze.
- Store ZARXIO in the original pack to protect it from light.
- Do **not** shake ZARXIO.
- Take ZARXIO out of the refrigerator 30 minutes before use and allow it to reach room temperature before preparing an injection.
- ZARXIO may be allowed to reach room temperature for up to 24 hours. Throw away (dispose of) any ZARXIO that has been left at room temperature for longer than 24 hours.
- After you inject your dose, throw away (dispose of) any unused ZARXIO left in the prefilled syringe. **Do not** save unused ZARXIO in the prefilled syringe for later use.

## Keep ZARXIO and all medicines out of the reach of children.

### General information about the safe and effective use of ZARXIO:

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use ZARXIO for a condition for which it was not prescribed. Do not give ZARXIO to other people, even if they have the same symptoms that you have. It may harm them. You can ask your pharmacist or **healthcare provider** for information about ZARXIO that is written for healthcare professionals.

### What are the ingredients in ZARXIO?

**Active ingredient:** filgrastim-sndz

**Inactive ingredients:** glutamic acid, polysorbate 80, sorbitol, sodium hydroxide, water for injection

Manufactured by: Sandoz Inc., Princeton, NJ 08540, US License No. 2003

At: Sandoz GmbH, Langkampfen, Austria, Product of Austria

For more information visit [www.zarxio.com](http://www.zarxio.com) or call 1-800-525-8747.

This Patient Information has been approved by the U.S. Food and Drug Administration.  
Revised: 03/2021

## Instructions for Use

### ZARXIO® (zar-zee-oh)

### (filgrastim-sndz)

### injection

### Important:

- **Do not inject yourself or someone else until you have been shown how to inject ZARXIO.** Your healthcare provider or nurse will show you how to prepare and inject ZARXIO properly using the ZARXIO prefilled syringe with UltraSafe Passive® Needle Guard. Talk to your healthcare provider or nurse if you have any questions.
- You should not inject a dose of ZARXIO less than 0.3 mL (180 mcg) from a ZARXIO prefilled syringe. A dose less than 0.3 mL cannot be accurately measured using the ZARXIO prefilled syringe.
- **Do not use** the ZARXIO prefilled syringe if either the seal on the outer pack or the seal of the blister are broken.

- Keep the ZARXIO prefilled syringe in the sealed pack until you are ready to use it.
- **The needle cap on the prefilled syringe contains natural rubber (derived from latex). Do not handle the prefilled syringe if you are allergic to latex.**
- The prefilled syringe has a needle guard that will be activated to cover the needle after the injection is given. The needle guard will help prevent needle stick injuries to anyone who handles the prefilled syringe.
- Avoid touching the syringe needle guard wings before use. Touching them may cause the syringe needle guard to be activated too early.
- Do not remove the needle cap until just before you give the injection.
- Throw away (dispose of) the used ZARXIO prefilled syringe right away after use. **Do not re-use a ZARXIO prefilled syringe.** See “How should I dispose of used ZARXIO prefilled syringes?” at the end of this Instructions for Use.

### How should I store ZARXIO?

- Store ZARXIO in the refrigerator between 36°F to 46°F (2°C to 8°C).
- Protect from freezing ZARXIO. If frozen, thaw in the refrigerator before use. Throw away (dispose of) if it has been frozen more than 1 time.
- Store ZARXIO in the original pack to protect it from light.
- Avoid shaking ZARXIO.
- Take ZARXIO out of the refrigerator 30 minutes before use and allow it to reach room temperature before preparing an injection.
- ZARXIO may be allowed to reach room temperature for up to 24 hours. **Throw away (dispose of) any ZARXIO that has been left at room temperature for longer than 24 hours.**
- After you inject your dose, throw away (dispose of) any unused ZARXIO left in the prefilled syringe. Do not save unused ZARXIO in the prefilled syringe for later use.

### Keep ZARXIO and all medicines out of the reach of children.

#### About the ZARXIO prefilled syringe:

- ZARXIO prefilled syringes come in two strengths. Depending on your prescription, you will receive ZARXIO prefilled syringes that contain 300 mcg/0.5 mL or 480 mcg/0.8 mL of medicine. Your healthcare provider will determine the dose in milliliters (mL) that you will need to give based on your body weight.
- When you receive your ZARXIO prefilled syringes, always check to see that the:
  - o name ZARXIO appears on the pack and prefilled syringe label.
  - o expiration date on the prefilled syringe label has not passed. **You should not use a prefilled syringe after the date on the label.**
  - o strength of ZARXIO (number of micrograms on the pack containing the prefilled syringe) is the same as what your healthcare provider prescribed.

**ZARXIO prefilled syringe parts (see Figure A).** ZARXIO 300 mcg /0.5 mL prefilled syringe is shown as an example.

#### Figure A

## What you need for your injection:

Included in the pack:

- A new ZARXIO prefilled syringe

Not included in the pack (**see Figure B**):

- 1 Alcohol wipe
- 1 Cotton ball or gauze
- Sharps disposal container
- 1 Adhesive bandage

## Figure B

See “**How should I dispose of used ZARXIO prefilled syringes?**” at the end of this Instructions for Use.

## Preparing the ZARXIO prefilled syringe

Step 1. Find a clean, well-lit, flat work surface.

Step 2. Take the pack containing the ZARXIO prefilled syringe out of the refrigerator and leave it **unopened on your work surface** for about 30 minutes so that it reaches room temperature.

Step 3. Wash your hands well with soap and water.

Step 4. Remove the ZARXIO prefilled syringe from the outer pack and take it out of the blister.

Step 5. Check the expiration date. **Do not use** the ZARXIO prefilled syringe if the expiration date has passed.

Step 6. Look through the viewing window on the ZARXIO prefilled syringe. The liquid inside should be clear. The color may be colorless to slightly yellow. You may see a small air bubble in the liquid. This is normal. Do not use the prefilled syringe if the liquid contains visible particles, or if the liquid is cloudy or discolored. Return the ZARXIO prefilled syringe and the package it came in to your pharmacy.

Step 7. Do not use a ZARXIO prefilled syringe if it is broken. Return the broken prefilled syringe and the package it came in to your pharmacy.

Step 8. Check to make sure that the plastic transparent needle guard is covering the barrel of the glass syringe. If the transparent needle guard is covering the needle cap (see **Figure C**) the needle guard has already been activated. **Do not use the prefilled syringe.**

Get another prefilled syringe that has not been activated and is ready to use (see **Figure D**).

**Figure C** shows a needle guard that has already been activated. **Do not use a ZARXIO prefilled syringe that has been activated.**

**Figure C Do Not Use**

**Figure D** shows a needle guard that has not yet been activated. The prefilled syringe is ready for use.

**Figure D Ready to Use**

Step 9: Choose the injection site:

- Areas of your body that you may use as injection sites include:
  - o the front of your thighs (**see Figure E**)
  - o the lower stomach-area (abdomen), but not the area 2 inches around your navel (belly button) (**see Figure E**)
  - o if a caregiver is giving you the injection
  - o upper outer arms (**see Figure E and Figure F**)
  - o upper areas of the buttocks (**see Figure F**)
- Choose a different site each time you give yourself an injection.

- **Do not** inject into areas where the skin is tender, bruised, red, scaly, or hard. Avoid areas with scars or stretch marks.

**Figure E**

**Figure F**

Step 10. Clean the injection site using a circular motion with the alcohol wipe. Leave it to dry before injecting. Do not touch the cleaned area again before injecting.

### **Giving your injection**

Step 11. Hold the prefilled syringe by the body (the clear plastic needle guard) with the needle pointing up (**see Figure G**). Holding the syringe with the needle pointing up helps to prevent medicine from leaking out of the needle. Carefully pull the needle cap straight off. Throw away the needle cap.

**Figure G**

Step 12. Check the syringe for an air bubble. Gently tap the syringe with your fingers until the air bubble rises to the top of the syringe (**see Figure H**). Slowly push the plunger up to push any air out of the syringe and stop when you see a small drop start to appear at the needle tip (**see Figure H**).

**Figure H**

Step 13. Holding the syringe as shown, press slowly on the plunger to push out the excess medicine until the edge of the conical base of the plunger stopper lines up with the syringe marking for your prescribed dose. See **Figure I**, example for a dose of 0.4 mL.

Be careful not to touch the needle guard wings before use. The needle guard may be activated too early.

Check again to make sure the correct dose of ZARXIO is in the syringe.

Call your healthcare provider or nurse if you have problems measuring or injecting your dose of ZARXIO.

**Figure I**

Step 14. With one hand gently pinch the skin at the injection site. With your other hand insert the needle into your skin as shown (**see Figure J**). Push the needle all the way in to make sure that you inject your full dose.

**Figure J**

Step 15. Hold the ZARXIO prefilled syringe as shown (**see Figure K**). Slowly press down on the plunger as far as it will go so that the plunger head is completely between the needle guard wings. Keep the plunger pressed fully down while you hold the syringe in place for 5 seconds.

**Figure K**

Step 16. Keep the plunger fully pressed down while you carefully pull the needle straight out from the injection site (**see Figure L**).

**Figure L**

Step 17. Slowly release the plunger and allow the needle guard to automatically cover the exposed needle (**see Figure M**).

**Figure M**

Step 18. There may be a small amount of blood at the injections site. You can press a cotton ball or gauze over the injection site and hold it for 10 seconds. Do not rub the injection site. You may cover the injection site with a small adhesive bandage, if needed.

### **How should I dispose of (throw away) used ZARXIO prefilled syringes?**

Put your used prefilled syringes in a FDA-cleared sharps disposal container right away after use (**see Figure N**). **Do not throw away (dispose of)** ZARXIO prefilled syringes in your household trash.

#### **Figure N**

If you do not have an FDA-cleared sharps disposal container, you may use a household container that is:

- made of a heavy-duty plastic,
- can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
- upright and stable during use,
- leak-resistant, and
- properly labeled to warn of hazardous waste inside the container.

When your sharps disposal container is almost full, you will need to follow your community guidelines for the right way to dispose of your sharps disposal container. There may be state or local laws about how you should throw away used needles, syringes, and prefilled syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA's website at: <http://www.fda.gov/safesharpsdisposal>.

Do not reuse the prefilled syringe.

Do not recycle the syringe, or sharps disposal container or throw them into household trash.

**Important:** Always keep the sharps disposal container out of the reach of children.

This Instructions for Use has been approved by the U.S. Food and Drug Administration.
